2066	-	-	2116	-	-
2067	-	-	2117	-	-

The baseline harvest volumes were determined by modeling a harvest and growth regime considering all required and relevant legal constraints and financial considerations. The cubic foot volumes were calculated on cut trees the same way as onsite carbon stocks were for both the baseline and project, i.e. using the ARB/FIA cubic foot volume equations. For more detail, see Appendix A in general and the Baseline Model Constraints section specifically.

The project harvest volumes were summarized from the OPO's harvest records. Note, in this particular case the OPO has not harvested in the project area since the project commencement date.
