QIANTAI ADJUSTED WATER MANAGEMENT IN RICE CULTIVATION

Document Prepared by Shenzhen CTI International Certification Co., Ltd

Project Title	<i>Qiantai Adjusted Water Management in Rice Cultivation</i>
Version	1.0
Report ID	CTI/NB-2020-1123

Report Title	<i>VCS Validation report for Qiantai Adjusted Water Management in Rice Cultivation</i>
Client	<i>Shanghai Libra Investment & Management Co., Ltd.</i>
Date of Issue	<i>01-June-2021</i>
Prepared By	<i>Shenzhen CTI International Certification Co., Ltd (CTI)</i>
Contact	<i>Shenzhen CTI International Certification Co., Ltd F8-A CTI Building, No.4 LiuXianSan Road, Xin'an Street Bao'an District, Shen Zhen 518101, P. R. China Phone: +86-10-65580012 https://www.cti-cert.org/</i>

Approved by	Zhou Lu
Work carried out by	Lin Shunrong (TL& validator) Yan Shun (TE for TR) Wang Guolian (TR)

Summary:

The main points included in the validation report are summarized as follows:

- *The main content of the validation and the project*

The project activity developed in Qianshan City and Taihu County within the Anqing City, Anhui Province, P. R. China, is a Project that change the water regime during the rice cultivation period. It changes continuously flooded to intermittent flooded condition during rice cultivation so that to result in reduced anaerobic decomposition of organic matter in rice cropping soils and thus reduced generation of methane. The Project involves a total acreage of 12,997 ha for double-cropping rice. With the replacing of the continuously flooded method by intermittent flooded method, the project solves the problems of excessive water used during rice cultivation and expected to decrease 48% of the CH₄ emission. The project is expected to achieve 53,512 tCO₂e of emission reduction annually. The project was allocated with VCS ID 2398.

The approved CDM methodology AMS-III.AU "Methane Emission Reduction by Adjusted Water Management Practice in Rice Cultivation" (version 04.0) is applied to assess the baseline and additionality, also quantify the GHG removals achieved in this project.

- *Validation objective and range*

The validation objective is an independent assessment by a Third Party of a proposed project activity against all defined criteria set for the registration under the VCS. In order to confirm that the project activity, as documented, is sound reasonable and meets the identified criteria, the validation involves the assessment of: project conformance to VCS standards/programs, project conformance to the applied methodology, including the procedure for the demonstration of additionality specified in the methodology; and likelihood that methods and procedures set out in the project description will generate verifiable GHG data and information when implemented. Validation is a requirement and is seen as necessary to provide assurance to stakeholders of the quality of project and its intended generation of VCUs. Validation is part of the VCS project cycle and will finally result in a conclusion by the executing VVB whether a project activity is valid to be submitted for registration to VCS registry.

- *The means and standards used for validation*

Validation is conducted using Shenzhen CTI International Certification Co., Ltd (CTI) procedures in line with the requirements specified in the latest version of the VCS Validation and Verification Manual and applying auditing techniques. The validation team assessed the project activity's compliance against the VCS Version 4.1, the selected CDM methodology and the project description. The project is eligible under VCS Project Scope 14 (AFOLU). The validation criteria followed the guidance documents provided by VCS included the following:

VCS Version 4.1, VCS Program Guide Version 4.0 and the applied CDM methodology "Methane Emission Reduction by Adjusted Water Management Practice in Rice Cultivation" (version 04.0).

- *The quantity of findings raised during validation*

In the course of the validation, 16 Corrective Action Requests (CARs), 4 Clarification Requests (CLs) were raised and successfully closed. The assessment is included in the report.

- *Any uncertainties related to the validation*

There are no restrictions of uncertainty for validation.

- *Overview of the validation conclusion*

Shanghai Libra Investment & Management Co., Ltd. has commissioned the CTI to carry out the Verified Carbon Standard (VCS) validation of the project, “Qiantai Adjusted Water Management in Rice Cultivation” (VCS ID 2398) with regard to the relevant requirements of VCS standard Version 4.1. CTI confirms all validation activities including objectives, scope and criteria, level of assurance, project description and monitoring plan adhere to VCS Version 4.1 and all associated updated as documented in this report, are complete.

CTI concludes that the project activity “Qiantai Adjusted Water Management in Rice Cultivation” in China, as described in the Project Description version 02 of 28-May-2021, meets all relevant requirements for VCS validation activity and correctly applied the methodology AMS-III.AU Version 04.0. Hence CTI is able to provide positive validation opinion as per the requirement of VCS.

1 INTRODUCTION

1.1 Objective

Shanghai Libra Investment & Management Co., Ltd. has commissioned the CTI to carry out the Verified Carbon Standard (VCS) validation of the project “Qiantai Adjusted Water Management in Rice Cultivation” (VCS ID 2398).

The objective of validation is an independent assessment by a Third Party of a proposed project activity against all defined criteria set for the registration under the VCS. In order to confirm that the project activity, as documented, is sound reasonable and meets the identified criteria, the validation involves the assessment of: project conformance to VCS standards/programs, project conformance to the applied methodology, including the procedure for the demonstration of additionality specified in the methodology; and likelihood that methods and procedures set out in the project description will generate verifiable GHG data and information when implemented. Validation is a requirement and is seen as necessary to provide assurance to stakeholders of the quality of project and its intended generation of VCU. Validation is part of the VCS project cycle and will finally result in a conclusion by the executing VVB whether a project activity is valid to be submitted for registration to VCS registry.

1.2 Scope and Criteria

The validation scope is defined as an independent and objective review of the project design document (PD) to validate that (a) the project design is actual, (b) the baseline scenario is correctly defined as per the applied methodology and related tools, (c) the project is additional, (d) the monitoring plan can be implemented and is transparent and adequate and (e) all data and information used for ex-ante calculation of emission reductions is of projected and/or hypothetical nature. The PD is reviewed against the criteria stated in VCS standard Version 4.1 and the approved baseline and monitoring methodology AMS-III.AU version 04.0. The validation was based on the requirements VCS Validation and Verification Manual and VCS programs and VCS standard version 4.1 applying auditing techniques. The validation is not meant to provide any consulting towards the project participants. However, stated requests for clarifications and/or corrective actions may have provided input for improvement of the project design.

1.3 Level of Assurance

The validation report is based on the VCS-PD, supporting evidences made available to the validator and information collected through performing interviews and during the on-site assessment.

The validation conclusion is assured a reasonable level of assurance.

1.4 Summary Description of the Project

The project is implemented by Hefei Luyu Agricultural Technology Co., Ltd which aims to change the water regime during the rice cultivation period. It changes continuously flooded to intermittent flooded condition during rice cultivation so that to result in reduced anaerobic decomposition of organic matter in rice cropping soils and thus reduced generation of methane. The Project involves a total acreage of 12,997 ha for double-cropping rice. With the replacing of the continuously flooded method by intermittent flooded method, the project solves the problems of excessive water used during rice cultivation and expected to decrease 48% of the CH₄ emission. The project is expected to achieve 53,512 tCO₂e of emission reduction annually. It is located inside the Qianshan City and Taihu County, Anhui Province, China.

The baseline scenario is the same to the status prior to the implementation of the project, i.e. continuation of the current practice which is continuously flooded water regime without any organic amendment during rice cultivation in the project fields.

The project activity generates GHG emission reductions by changes continuously flooded to intermittent flooded condition during rice cultivation. Thus the project generates GHG emission reductions and produces financial, social and environmental benefits. The project has resulted in the local sustainable development as described in Section 1 of the PD.

2 VALIDATION PROCESS

2.1 Method and Criteria

A project specific validation plan was developed to guide the validation auditing process to ensure efficiency and effectiveness.

The purpose of the validation is to present a risk assessment for determining the nature and extent of validation procedures necessary to ensure the risk of auditing error is reduced to a reasonable level. According to the ISO14064-3, the criteria are the policy, procedure or requirement used as reference against which evidence is compared. Therefore, validation of the project description and the reported project results were measured for compliance against the following criteria:

The validation method of the project consisted of the following steps:

- Contract review
- Appointment of team members and technical reviewers
- Publication of the VCS project description (VCS PD)/1/
- A desk review of the VCS PD/1/ submitted by the client and additional supporting documents with the use of customised validation documents checklist
- Validation planning
- On-Site assessment
- Background investigation and follow-up interviews with personnel of the project developer and related farmers
- Draft validation reporting
- Resolution of Corrective Action Requests (CARs) and Clarification Requests (CLs)
- Final validation reporting
- Technical review
- Final approval of the validation.

The validation criteria consisted of the following:

- VCS Program Guide, v4.0/42/
- VCS Standard, v4.1/43/
- Program Definitions, v4.1/41/
- AFOLU Non-Permanence Risk Tool, v4.0/39/
- CDM methodology AMS-III.AU "Methane Emission Reduction by Adjusted Water Management Practice in Rice Cultivation" (version 04.0)/34/
- CDM Standard for Sampling and Surveys for CDM Project Activities and Programme of Activities, V8.0/35/
- CDM Guideline for Sampling and Surveys for CDM Project Activities and Programme of Activities, V4.0/36/
- CDM methodological tool Demonstration of Additionality of Small-scale Project Activities (version 13.1)/37/

The validation process derived from all items in the validation criteria stated above. Field sampling and techniques based on the project parameters, scope and best professional judgement of the validation team in order to meet a reasonable level of assurance.

PP sampling approach

PP has applied a sampling method for the baseline survey, details are stated as below,

In the project area of 12,997 ha, there are 3,713 households involved in the project due to rice paddies in the project area belong to these farmers via checking the cooperation agreements signed between the project proponents and all the farmers which ensure the proper development of the project/11/. All the farmers are located in project area in Qianshan City and Taihu County¹ within the Anqing City, Anhui province, which is a limited area. Simple random sampling approach was selected for this project due to relatively homogenous population being studied, given the similar soil condition and similar cultivation habit of farmers in Qianshan City and Taihu County. Therefore, simple random sampling (SRS) approach was followed by the PP to determine the sample size for baseline survey, and it is able to confirm the selection of sampling approach is appropriate as per validation team's local knowledge. Target population is defined as all the 3,713 households included in the project.

As per the applied methodology and PD, a simple random sampling was drawn by the PP from the farmers database/15/ in line with the Guidelines for Sampling and Surveys for CDM Project Activities and Programme of Activities (hereafter can be referred to as the 'sampling guideline') (version 04.0)/36/.

The sample size of the baseline survey considering the parameters is calculated in a conservative way, and the least number of the sample size is 89. The sample size calculation process is verified by the validation team and confirmed as in line with the sampling guideline/36/, thus the result is confirmed as correct and reasonable. Furthermore, to be conservative, PP has selected 100 farmer samples to conduct the baseline survey.

An Ex-ante investigation report with investigation of 100 samples/16/ was supplied by the PP, which was compiled base on the survey done by the Anhui Academy of Social Sciences. In the Survey report, name of farmers, location, rice cultivation type, flooding type, rice type, cropping season type etc. were investigated and recorded. Via interview with the PP and representative from Anhui Academy of Social Sciences, it is confirmed that 100 farmers are randomly selected from the 3,713 households list by the simple random sampling (SRS) method. The excel function "randbetween" is employed to choose the farmers sample group. It is able to confirm that the sampling approach was consistent with the related requirements.

VVB sampling approach

The sampling plan during on-site validation is determined considering the accessibility and similitude of the areas and the tool for sampling was referred by validation team for the site validation.

The validation team reviewed the Ex-ante investigation report/16/and crosschecked with the inspection during the on-site period, including 21 random famers interview and related cultivation area visit. Verified whether the sample plan is reasonable to conduct and the implementation and results of the sample survey can be accepted.

As per the Standard for Sampling and Surveys for CDM Project Activities and Programme of Activities, V8.0/35/ (hereafter referred to as the "sampling standard"), CTI has applied acceptance sampling to verify the results of the baseline survey.

¹ Qianshan City and Taihu County are all prefecture-level cities of Anqing City.

Using own professional judgement, it is assumed that the Acceptable Quality Level (AQL) is 1% and the Unacceptable Quality Level (UQL) is 20% for this project. The maximum error of producer's risk is assumed at 5% and consumer's risk is assumed at 10%, in compliance with the sampling standard/35/. Based on these assumptions, the validation team refers to the sampling standard and sampling guideline and found that sample size should be not less than 18 and acceptance number is 1.

To be more conservative, before the on-site visit, CTI determined 21 as the sample size and randomly selected 21 from the survey list of the 100 samples. For the randomly selection of 21, a pre-randomized order of numbers ranging from 1-100 as calculated by Excel's RAND() function was brought to the field and a farmer list prepared in the field. If for example, the first number is 5, then the farmer name that was listed 5th on the farmer list would be the one to be surveyed.

During on-site visit, 21 farmers (total sample size) were chosen by the validation team randomly to check the correctness of data that need to be determined. This considered to be a good practice.

The 21 selected farmers from Ex-ante investigation report/16/ are interviewed and site inspected by validation team from the sampling conducted by the PP. Via the information got during site interview and inspection of the field condition comparing with the PP's data in the sample records/16/, it is found that all information is consistent between each other. No discrepancy is found between the sample records/16/ and the site validation sample results. And all the samples confirmed that they participated in the PP's baseline sampling survey.

As there are no discrepant records, i.e. the discrepant record is less than the acceptance number of 1, the sample records/16/ is accepted as per "Sampling and Surveys for CDM Project Activities and Programme of Activities"/35/.

2.2 Document Review

The VCS PD/1/ and supporting background documents related to the project implementation were reviewed. Documents review was conducted to ensure consistency with and identify any deviation from VCS program requirements. Desk review included an examination of the project design details, baseline scenario, additionality, ex ante and monitoring data and parameters, and ex ante quantification of GHG emission reductions.

Furthermore, the validation team used additional documentation by third parties like host party legislation, technical reports referring to the project design details, baseline scenario, additionality, monitoring or to the basic conditions and technical data.

The references used in the course of this validation are summarized in Appendix 3.

The validation was performed basing on the documents check and site inspection/measurements, refer to the section 3 of this report for the validation process detail and Appendix 3 for corresponding documents review.

2.3 Interviews

The objective of the interview process was to solicit important information from personnel related to project and relevant to the validation process. Onsite interviews and information discussions were conducted with project implementer/11/, local officer from Agricultural Bureau/12/, expert from Anhui Academy of Agricultural Sciences/13/, technicians from local agrotechnical stations/14/, rice cultivation farmers/15/ and Project VCS development consultant/16/. The interviews were performed by the validation team on-

site (Hefei City and the project area in Qianshan City and Taihu County, Anhui Province, P.R. China) and the following is a list of the main interviewees and subject.

No.	Interviewee			Date	Subject	Team member

2.4 Site Inspections

The validation site inspection was conducted on 12-April-2021, 22~24-April-2021. A ground inspection of the project area was conducted during the site visit and members of the validation team interviewed 21 farmers and also visited 21 farmers' cultivation area within the project area. During the site inspection the validation team was accompanied by the project developer, consultant and technicians.

During the site inspection, the project area was inspected and documents evidence were checked, details as following table,

Duration of on-site inspection: 12-April-2021, 22~24-April-2021				
No.	Activity performed on-site	Site location	Date	Team member
1.	Opening meeting Interview with PP, experts, consultant representatives ² , Monitoring instruments check in laboratory	Office in Hefei Luyu Agricultural Technology Co., Ltd. and laboratory of Institution of Agricultural Engineering, Anhui Academy of Agricultural Sciences in Hefei City, Anhui Province, P.R. China	12-April-2021	Lin Shunrong
2	On-site inspection Interview with sampled farmers and technicians	Project Area in Qianshan City and Taihu County, Anhui Province, P.R. China	22-April-2021~24-April-2021	
3	Documents check	Project Area in Qianshan City and Taihu County, Anhui Province, P.R. China	24-April-2021	
4	Finding Summary	Project Area in Qianshan City and Taihu County, Anhui Province, P.R. China	24-April-2021	
5	Close Meeting	Project Area in Qianshan City and Taihu County, Anhui Province, P.R. China	24-April-2021	

Due to this is the validation, the main purpose is to check if the project design and baseline scenario is actual determined in the PD. Thus the validation team interviewed 21 farmers and also visited 21 farmers'

² Four projects' (2362, 2397, 2398, 2399) opening meeting was conducted together on 12-April-2021.

cultivation area within the project area plus three baseline reference field. These areas can represent the characteristics of project area, thus used as sampling area for checking the project design and cultivation and flooding approach. The baseline reference field represent the baseline scenario.

Hence during the site inspection, the 21 sampled areas are determined by the validation team by checking the map of the project location, details as following table,

Table 2-1 Locations for site inspection

Site Visit time	Area	Coordinates		Inspection Results
Project Area				
22-April-2021	Limin Village	116.5872152 E	30.60464957 N	Each area is verified as located in the project boundary by checking the geographical coordinates and KML file. Cultivation and flooding approach are consistent as project design

2.5 Resolution of Findings

Material discrepancies identified in the course of the validation are addressed either as CARs, CLs or FARs.

A Corrective Action Request (CAR) is established where:

The project participants have made mistakes that will influence the ability of the project activity to achieve real, measurable additional emission reductions;

The VCS Version 4.1 requirements have not been met;

There is a risk that the emission reductions cannot be monitored or calculated.

A Clarification Request (CL) will be issued where information is insufficient, unclear or not transparent enough to establish whether a requirement is met.

A Forward Action Request (FAR) will be issued when certain issues related to project implementation should be reviewed during the next verification.

A detailed list of the CARs CLs and FAR raised and discussed in the course of this validation is included in Appendix 4 of this report.

In the course of the validation 16 Corrective Action Requests (CARs), 4 Clarification Requests (CLs) were raised and successfully closed. The assessment is included in the report.

2.5.1 Forward Action Requests

This is the validation, thus there is no FAR raised previously and also there is no FAR raised during this validation.

3 VALIDATION FINDINGS

3.1 Project Details

- **Type of project, technologies and measures implemented, and qualifications of the project**

Type and scope:

Through the onsite visit, interviewing the project developer and reviewing the project design, it was confirmed that the project was implemented to change the water regime during the rice cultivation period. It changes continuously flooded to intermittent flooded condition during rice cultivation so that to result in reduced anaerobic decomposition of organic matter in rice cropping soils and thus reduced generation of methane. The Project involves a total acreage of 12,997 ha for double-cropping rice.

As per the Appendix 1 Eligible AFOLU project categories in VCS standard Version 4.1/43/, CTI confirmed that the project belongs to one type of AFOLU categories, i.e. Agricultural Land Management (ALM). While eligible ALM activities are those that reduce net GHG emissions on croplands and grasslands by increasing carbon stocks in soils and woody biomass and/or decreasing CO₂, N₂O and/or CH₄ emissions from soils. By checking the project design, CTI confirmed that the project is applicable to one of eligible ALM activities, i.e. Improved Cropland Management (ICM). For ICM, as per the standard, “this category includes practices that demonstrably reduce net GHG emissions of cropland systems by increasing soil carbon stocks, reducing soil N₂O emissions, and/or reducing CH₄ emissions”, and through the onsite visit, interviewing the project developer and reviewing the project design, CTI confirmed that the project takes practices to reduce CH₄ emissions of cropland systems by change the water regime during the rice cultivation period from continuously flooded to intermittent flooded condition so as to increase soil carbon stocks, thus CTI verified that the sectoral scope 14: “Agriculture, Forestry, and other Land Use (AFOLU) is applicable to the project. Furthermore, via checking the email confirmation from VERRA dated on 19-November-2020/28/, CTI verified that VERRA also confirm that Project type is considered an AFOLU project under the VCS Program. This is in accordance with the definitions of eligible AFOLU project categories set out in Appendix 1 of the VCS Standard, v4.1. So although the project applied CDM approved methodology AMS-III.AU: Methane Emission Reduction by Adjusted Water Management Practice in Rice Cultivation, version 4.0 (which belongs to scope 15 as per the EB’s definition), the sectoral scope 14: “Agriculture, Forestry, and other Land Use (AFOLU) is confirmed to be applicable to the project.

It was confirmed that the project is not a grouped project.

Technologies and measures implemented:

The information and descriptions reported in section 1.1 of the VCS PD/1/ have been checked.

Qiantai Adjusted Water Management in Rice Cultivation (hereinafter referred to as the Project) is a Project that change the water regime during the rice cultivation period. It changes continuously flooded to intermittent flooded condition during rice cultivation so that to result in reduced anaerobic decomposition of organic matter in rice cropping soils and thus reduced generation of methane. The Project involves a total acreage of 12,997 ha for double-cropping rice.

Via site inspection with rice lands/32/ and interview with farmer representatives/15/, it is confirmed that before the project implementation, the paddy fields are regarded as an isolate unit and the rice was continuously flooded, and with the project, the cement ditches and reservoirs were constructed to conduct the intermittent flooded water regime during rice cultivation. With the replacing of the continuously flooded

method by intermittent flooded method, the project solves the problems of excessive water used during rice cultivation and expected to decrease 48% of the CH₄ emission.

Via checking the PD/1/, it is confirmed that the scenario existing prior to the implementation of the project as stated in the PD is rice was cultivated by continuously flooded method. The baseline scenario is the same as the scenario existing prior to the implementation of the project activity, which has been confirmed during the site interview with local officer/12/ and agricultural experts/13/ and sampled farmers/15/ and checking the Ex-ante investigation report/16/. Thus it is verified that the baseline scenario is reasonable and correct.

The project activity generates CH₄ emission reductions by build ditches for applying intermittently flooded method in project area, that otherwise continuously flooded method was used in rice paddies, which means fields have standing water throughout the rice growing season and may only dry out for harvest and in this condition, the organic matter in rice soil under flooded condition would emit a large amount of methane (CH₄) because of anaerobic decomposition. Due to the CH₄ in rice paddies is produced by the anaerobic decomposition of organic matter after the flooding, hence through the project that allows the field to drain halts CH₄ production, which happens in anaerobic condition, reducing the total quantity of CH₄ released during the cropping season.

The project will not only generate GHG emission reductions but also save water, increase production thus produce financial, social and environmental benefits.

The expected total emission reduction of the Project in the first crediting periods of 7 years (from 24-February-2018 to 23-February-2025) is 374,584 tCO₂e, and the annual emission reduction is estimated to be 53,512 tCO₂e.

In conclusion, it is verified that the summary description of the project in section 1.1 is in line with the PD template requirements and all the information has been provided and verified as correct.

Eligibility of the project:

The PP has described and justified how the project is eligible under the scope of the VCS Program in PD as per the section 2.1.1 of VCS standard Version 4.1. The assessment is provided as below,

1. The project activity generates GHG emission reductions including CH₄ which belong to the six Kyoto Protocol greenhouse gases which belongs to scope 1) of section 2.1.1 of VCS standard Version 4.1.
2. Via checking the PD of the project, it is verified that the project is implemented to change the water regime during the rice cultivation period. It changes continuously flooded to intermittent flooded condition during rice cultivation so that to result in reduced anaerobic decomposition of organic matter in rice cropping soils and thus reduced generation of methane, and the additionality is verified as actual, thus there is no assumption of having generated GHG emissions primarily for the purpose of their subsequent reduction, removal or destruction for this project.
3. Via checking all the excluded project activities in the table, it is verified that this project type is not excluded by the scope of VCS program.

In conclusion, the project is eligible to the scope of the VCS Program.

- **Project design, including eligibility criteria for grouped projects**

The project has not been designed to include a single installation of an activity, multiple project activity instances, or as a grouped project.

- **Project proponent and other entities involved in the project**

The project proponent (Hefei Luyu Agricultural Technology Co., Ltd.) and the contact information reported in section 1.5 of the VCS PD have been confirmed to be correct through checking the business license of the company/12/, the project approval/8/ and interviewing with the PP representative through the on-site visit/11/.

The other entities involved in the Project (Shanghai Libra Investment & Management Co., Ltd.) and the contact information reported in section 1.6 of the VCS PD have been confirmed to be correct through checking the business license of the Shanghai Libra Investment & Management Co., Ltd./12/ and interviewing the representative of this company during the on-site visit/16/.

- **Ownership**

The section 1.7 of the PD has been checked, and during the on-site visit and checking the business license/12/ of the participant parties, the government approval of the project/8/, and the carbon reduction project cooperation agreement signed between the farmers and Hefei Luyu Agricultural Technology Co., Ltd./11/, CTI verified that the project developer Hefei Luyu Agricultural Technology Co., Ltd. is a privacy company, who is in charge of the integrated implementation and management of the project. The rice paddies and agricultural fields involved in the project was owned by the farmers which has been confirmed by site interview with farmers/15/ and local officer from Agricultural Bureau/12/ and checking the Certification of land rights/10/.

The project proponent is responsible for the comprehensive implementation and management of the project and farmers also have right to authorize Hefei Luyu as a representative of the carbon project owner and Hefei Luyu only has the right to make decisions about the carbon reduction project which is confirmed by checking the carbon reduction project cooperation agreement signed between the farmers and Hefei Luyu Agricultural Technology Co., Ltd./11/ and interview with farmers/15/.

Furthermore, Hefei Luyu has already sold the carbon project development right to Shanghai Libra which has been verified in the emission reduction purchase agreement/18/, thus Libra leads the development and management of the carbon project.

- **Project start date**

The project start date is 24-February-2018 which is verified as the date on which the project land preparation was started. Via checking the Construction Contract/14/ and record in the farmer's database/15/, it is verified that the start date is correct and in line with the VCS standard Version 4.1.

- **Project crediting period**

For the VCS crediting period, PP has chosen 21 years renewable crediting period started from 24-February-2018 to 23-February-2039 which is in line with the concept for crediting period in section 3.8.2 of the VCS standard 4.1.

- **Project scale and estimated GHG emission reductions or removals**

The average annual ERs of the project are 53,512 tCO₂e, which is lower than the threshold of large-projects (300,000 tCO₂e per year). Therefore the project falls in the category of "Project" as per definition in VCS standard. And the estimated total Estimated GHG Emission Reductions or Removals during the 1st 7 years of VCS crediting period (24-February-2018 to 23-February-2025) is 374,584 tCO₂e.

- **Project location**

The project site is located in Qianshan City and Taihu County, Anhui Province P. R. China. The geographical coordinates for the project site are listed as below table. The location of the project site is verified with on-site investigation by GPS devices and checking the google earth map/45/.

Table 3-1 Geographical coordinates for the project site

Name of City/County	Geographical Coordinates	
	Longitudes	Latitudes
Qianshan City	E 116° 14'~116° 46'	N 30° 27'~31° 04'
Taihu County	E 115° 45'~116° 30'	N 30° 09'~30° 46'

KML file with project boundary is checked as provided/5/, and is verified as consistent with the PD and on-site investigation by GPS devices and checking the google earth map/45/.

- **Conditions before project initiation**

The rice was planted under continuously flooded condition existing prior to the project in project area, the irrigation and drainage ditch of rice paddies was made up of soil, which is not enough to make the irrigation and drainage controllable which has been confirmed by checking the Ex-ante investigation report/16/ and interview with farmers/15/, the project is the construction of new drainage cement ditch and reservoirs. The conditions prior to project initiation has been validated in the PD to be the same as the baseline scenario identified in the PD section 3.4, i.e. continuation of the current practice which is continuously flooded water regime without any organic amendment during rice cultivation in the project fields in this project.

The baseline scenario is the same as the scenario existing prior to the implementation of the project activity, which has been confirmed during the site interview with local officer/12/, agricultural experts/13/ and local farmers/15/ and checking the Ex-ante investigation report/16/. Thus it is verified that the baseline scenario is reasonable and correct.

Therefore, the project is confirmed not to be implemented to generate GHG emissions for the purpose of their subsequent reduction, removal or destruction.

Due to the project is an AFOLU project, the appropriate information on the climate, hydrology, topography, relevant historic conditions, soils, vegetation and ecosystems including the present and prior environmental conditions of the project area has been provided in PD as assessed as correct and actual via site inspection and checking the public information and checking the Ex-ante investigation report/16/of the project area and also cross-checked by interview with local officer/12/, agricultural experts/13/ and local farmers/15/.

- **Project compliance with applicable laws, statutes and other regulatory frameworks**

The PD has stated that the project is in the field of agriculture, the rice cultivation and flooding is confirmed as in line with the laws and regulations as listed in the PD/31/. For the construction during the construction period, via checking the Inspection and Acceptance Report of the project/9/, it is verified that the construction is in line with the requirement of national laws and regulations as stated in the Inspection and Acceptance Report of the project/9/. Also the project is legally approved by Local government by checking the project approval/8/, which means that the project is in line with the national and local laws and regulations based on the local expertise of the VVB. And as stated in the PD and confirmed by interview with local officer/12/, CTI verified that the project will be subject to regular inspection by local government during the implementation period to ensure continuous compliance.

In conclusion, the project complies with all relevant local, regional and national laws, statutes and regulatory frameworks in China.

- **Participation under other GHG programs:**

- Projects registered (or seeking registration) under other GHG program(s)

The project has neither been registered nor seeking registration under any other GHG programs which has been confirmed via checking the UNFCCC/48/, GS/46/, VCS/49/ and other GHG schemes' website. It is verified that the project is seeking registration only in VCS program/49/.

- Rejection by other GHG programs

The project has neither been rejected by any other GHG programs which has been confirmed via checking the UNFCCC/48/, GS/46/, VCS/49/ and other GHG schemes' website.

- **Other forms of credit:**

- Emissions trading programs and other binding limits

The project proponent is not part of any emission trading program which has been confirmed via checking the UNFCCC/48/, GS/46/, VCS/49/ and other GHG schemes' website. The net GHG emission reductions from the project will not be used for compliance with emission trading programs or to meet binding limits on GHG emissions. The project activity has not participated under any other GHG programs which has been confirmed via checking the UNFCCC/48/, GS/46/, VCS/49/ and other GHG schemes' website.

- Other forms of environmental credit sought or received and eligible to be sought or received

Via interview with the project developer/11/ and based on above assessment, it is confirmed that the project has not created any other form of environmental credit.

- **Additional information relevant to the project, including:**

- Leakage management for AFOLU projects

According to the applied methodology AMS-III.AU (Version 04.0)/34/ and the demonstration in the PD and section 4.4.5.3 of this report, any effects of the project activity on GHG emissions outside the project boundary are deemed to be negligible and do not have to be considered under this methodology, thus the leakage of the project is zero. Thus no management involved.

- Commercially sensitive information

It is confirmed that no commercially sensitive information relevant to the project description has been excluded from the public version of the project description.

- Sustainable development contributions

The Project is confirmed contributing to sustainable development in the following ways which have been stated in the PD:

1. High yield brings extra income and improves the living standard of local farmers (Goal 1 of UN SDG);
2. Increase the rice productivity alleviates hunger problem (Goal 2 of UN SDG);
3. Use a proportion of benefits to improve the local children's education (Goal 4 of UN SDG);
4. Women are given priority for employment and their social status is raised (Goal 5 of UN SDG);
5. Provide more job opportunities for local farmers (Goal 8 of UN SDG);

6. Sequester greenhouse gas and mitigate climate changes (Goal 13 of UN SDG).

Based on above assessment and demonstration, it is concluded that the description in the PD is accurate, complete, and the nature of the project is actual and understandable, and it is confirmed that the project has been implemented as described in the PD via site inspection.

CL 01, CL 02, CL 03, CL 04, CAR 01, CAR 02, CAR 03, CAR 04 were raised and successfully closed. Refer to Appendix 4 for detail assessment.

3.2 Safeguards

3.2.1 No Net Harm

The analysis of the potential negative environmental and socio-economic impacts of the project activity is sufficiently described in PD. The assessment is as below,

It is considered that the environmental impacts and the relevant mitigation methods have been comprehensively described in Section 2.1 of PD including the large amount of construction waste could be generated and construction dust could be produced during the construction period, which will impact on the ecosystem and environment of local area in project area according to the project construction situation and interview with local experts and farmers.

Environmental Impacts- Associated with the interview with local experts and farmers, there was no adverse effect on the ecology, air, water and solid waste, for the project subject to the implementation of pollution mitigation measures during construction period according to the requirements of Anqing Municipal Construction Waste Disposal Management Measure/29/. There are no any negative impacts found in the project location during the project implementation.

Measures to mitigate - As per interview with local officer, it is confirmed that the inspectors from construction entity have to carry out supervision work for the environmental impact arisen from the project activity during construction period, made the wastes were uniformly classified and collected and kept water sprayed frequently to reduce dusts. Via interview with the farmers/15/, it is confirmed that they are satisfactory with the environmental protection work carried out.

During the on-site interview, the local farmer/13/ were interviewed if there was critical impact to their living environment. It is verified that the project activity does not cause adverse effect to their daily life.

Furthermore, via interview with local officers and farmers, it is confirmed that the implementation of the project will improve local socio-economic development through providing a part of funds as subsidies to farmers and providing trainings to technicians and farmers involved in this project which has been verified by checking the funds allocation receipts to farmers/17/ and the training records/25/.

In conclusion, there were some impacts on environment during the construction period which has been demonstrated in the PD, also the proper measurements have been carried out by project implementer to mitigate such impacts.

CAR 05 was raised and successfully closed. Refer to Appendix 4 for detail assessment.

3.2.2 Local Stakeholder Consultation

A stakeholder survey was carried out by the project developer during June 2017 which was prior to the start date of the project.

Survey questionnaires were distributed to relevant personnel of village representatives, relevant governmental officials, local farmers by the Anhui Academy of Social Sciences in June 2017, totally 100 copies of questionnaires were issued to relevant personnel with 100 pieces of reply received. The

stakeholders' background information and comments from questionnaires were summarized and recorded in the PD, Section 2.2.

Via checking the 100 filled questionnaires/23/, it is verified that all respondents knew or heard about the Project. Most of them are supportive of the project construction, and think the Project will bring more benefit than loss through reducing methane emissions, saving water resource and increasing the rice productivity. Most of the respondents are willing to participate in the construction and operation of the project and they have no opinions on the project implementation.

And some respondents have concerns about the construction funds and how to conduct intermittent flooded water regime well, these impacts have already been considered by the PP has taken related mitigation measures through providing a part of funds as subsidies to farmers and providing trainings to technicians and farmers involved in this project which has been verified by checking the funds allocation receipts to farmers/17/ and the training records/25/ so that the project can be implemented successfully. Finally, it is verified that there is no one thinks that the project will have a negative impact on the local life and environment, local stakeholders are supportive of the project construction by checking the questionnaires/23/, and thus no need to change the project design based on the stakeholder inputs.

For the project implementation, via site inspection checking the Suggestion Book published on the notice board of villages/24/, it is confirmed that there was no comments or suggestions in the book during the implementation period since 2018, and via interview with PP, it is verified that they will check the book regularly and collect all the comments received.

Via interview with the local officer/12/ and farmers/15/ during site visit, it is verified that there were no comments and issues from the local stakeholders during the construction and implementation period and the project approved by local government. Hence there is no need to change the project design based on the stakeholder inputs.

Furthermore, due to the project is an AFOLU project, according to the PD template, the special requests for the AFOLU projects have been demonstrated by PP in the PD. Assessment is listed as below,

Through villagers' meetings confirmed by interview with local farmers/15/ and checking the LSC records/23/, CTI verified that the project design and implementation, risks, costs and benefits are all communicated and informed with local stakeholders.

Informed farmers of all relevant laws and regulations covering workers' rights in the host country by Project implementer and under the supervision of the local agricultural bureau and government confirmed by interview with local officers/12/.

Informed farmers by publishing notification and invitation on the notice board about the process of VCS Program validation and verification and the validation/verification body's site visit confirmed by interview with local farmers/15/ and checking the notice board during site visit by VVB/32/.

CAR 06 was raised and successfully closed. Refer to Appendix 4 for detail assessment.

3.2.3 Environmental Impact

In China, according to Chinese law "Environmental Impact Assessment Law of the People's Republic of China", it is confirmed that there is no requirement from any environmental impact assessments to the type of the project. Hence the analysis of the environmental impacts of the project activity is sufficiently described by PP in the PD. The assessment is as below,

Associated with the interview with local experts and farmers, there was no adverse effect on the ecology, air, water and solid waste, for the project subject to the implementation of pollution mitigation measures during construction period according to the requirements of Anqing Municipal Construction Waste Disposal

Management Measure/29/. There are no any negative impacts found in the project location during the project implementation.

As per interview with local officer, it is confirmed that the inspectors from construction entity have to carry out supervision work for the environmental impact arisen from the project activity during construction period, made the wastes were uniformly classified and collected and kept water sprayed frequently to reduce dusts. Via interview with the famers/15/, it is confirmed that they are satisfactory with the environmental protection work carried out.

In conclusion, there were some negative impacts on environment during the construction period which has been demonstrated in the PD, also the proper measurements have been carried out by project implementer to mitigate such impacts. And by site inspection of implementation, it is confirmed that there are no obvious negative impacts during the implementation period only if the ditches would be damaged that may impact the water resources, however, with the proper measurements, this situation is unlikely to happen.

In conclusion, both positive and negative impacts to the environment from the project has been demonstrated and verified as actual and reasonable and there are no significant negative impacts to the environment were identified.

CAR 07 was raised and successfully closed. Refer to Appendix 4 for detail assessment.

3.2.4 Public Comments

The project sought the registration with the VCS Program, according to VCS requirements the Project Description was submitted for public comment period. The project was allocated with VCS ID 2398. The public comment period started on 11-January-2021 and ended on 11-February-2021 (<https://registry.verra.org/app/projectDetail/VCS/2398>).

No comments were received during this period which has been verified by checking the dedicated webpage.

3.2.5 AFOLU-Specific Safeguards

PD has provided the details of AFOLU-Specific safeguards related to the project and the assessment are demonstrated as below,

- Local stakeholder identification process and the description of results

The PD/1/ states that the stakeholders were identified as all communities, community groups, and other stakeholders who will be directly and indirectly affected by the implementation of the project.

The stakeholders are identified as village residents (including 9,828 farmers within 2,488 households in Qianshan City and 3,859 farmers within 1,225 households in Taihu County with a total of 13,701 farmers, of which 8,084 are females, accounting for about 59 percent) involved in the project area who are directly affected by the project activities, Agricultural Bureaus of Qianshan City and Taihu County that involved in providing the basic techniques of intermittently flooded method, local governments of Qianshan City and Taihu County involved in local social and environmental management, and village communities of Qianshan City and Taihu County involved in collecting opinions from the respective locals and villages.

Following approaches has been taken to validate the process of stakeholder identification and analysis as stepwised,

On-site inspection and interview

Via on-site inspection, VVB visited the project area and interviewed with the stakeholders representative from involved farmer, local officers, technicians, local experts. By seeing the project scenario and interview with stakeholders, it is confirmed the project is implemented in project area which impact the 3,713 households (13,701 farmers) in this area, and local government is responsible to the approval and related environmental and social issues, and during the project implementation, the local farmers involved in the project area are trained by the Agricultural Bureaus of Qianshan City and Taihu County and PP.

Checking the relevant docs and evidence

The stakeholders' identification is confirmed as complete by checking the related docs of project, carbon reduction project cooperation agreement signed between the farmers and Hefei Luyu Agricultural Technology Co., Ltd./11/which define the 3,713 households (13,701 farmers); Technical Training Record/25/ which are used to prove that techniques provided by the Agricultural Bureau of Qianshan City and Taihu County. The Village committees in project area is responsible for collecting opinions from the respective locals and villages with the project proponent by interview with local farmers/15/.

Therefore, CTI verified that each stakeholder is identified correctly, and relevant analysis and assessment, stakeholder's relevance to project activities in the PD is sufficient.

The list of primary stakeholders is provided in the PD and seems reasonable for a project of this nature. This is was confirmed during the on-site visit and the interview with the local stakeholders.

- Risks to local stakeholders and mitigation measures

The PD/1/ states the overall risks to the stakeholders are low, no major risks have arisen that may cause any loss of project benefits for the local community, climate and biodiversity, so that the long-term viability is assured.

- Risks to local stakeholder resources and mitigation measures

The PD/1/ states the overall risks to the stakeholder resources are low, no major risks have arisen that may cause any loss of project benefits for the local community, climate and biodiversity, so that the long-term viability is assured. Before the project implementation, the PP has got all the agreements from involved farmer as confirmed by checking the approval/8/ and checking the funds allocation receipts to farmers/17/ and interviewed with local farmers/15/, hence it is verified that project will not impact local stakeholder's property rights without the free, prior and informed consent.

- Processes to ensure ongoing communication and consultation

The PD describes a feedback and grievance redress process; a specific staff in charge of recording and collecting conflicts and grievances of local communities and individual villagers was nominated who is the first responsible for responding to requests from the community which has been confirmed during on-site interview with the project owner.

In addition, by interview with the residents, they confirm that they can either appeal through village representatives or directly to the local forestry bureau for their comments to the project.

PP promised that grievances will be addressed in a reasonable amount of time, usually contacted and discussed with relevant community within 3 days, answered and proposes a solution within 1 week in case of claims or complaints and dealt within 30 working days in case of suggestions. The PP declares to be available to adjust the grievance mechanism according the recorded dynamics and evaluation of effectiveness of the process in place.

For the project implementation, via site inspection checking the Suggestion Book published on the notice board of villages/24/, it is confirmed that there was no comments or suggestions in the book during the implementation period since 2018, and via interview with PP, it is verified that they will check the book regularly and collect all the comments received.

In conclusion, the feedback and grievance procedure is properly addressed.

CAR 08 was raised and successfully closed, Refer to Appendix 4 for detail assessment.

3.3 Application of Methodology

3.3.1 Title and Reference

The approved consolidated methodology applied in the project activity is AMS-III.AU-“Methane Emission Reduction by Adjusted Water Management Practice in Rice Cultivation” (version 04.0)/34/.

This methodology also refers to the latest approved version of the following tools and guidelines:

TOOL 21 “Demonstration of Additionality of Small-scale Project Activities (version 13.1)”/37/

“Standard for Sampling and Surveys for CDM Project Activities and Programme of Activities” (version 8.0)/35/

“Guideline for Sampling and Surveys for CDM Project Activities and Programme of Activities”, version 4.0/36/

3.3.2 Applicability

Demonstration regarding the applicability of the methodology, and any tools selected by the project proponent as provided in below table.

Table 3-2 Assessment of Applicability conditions of AMS-III.AU

No.	Applicability conditions	Validation Assessment	Conclusion
1	The methodology comprises technology/measures that result in reduced anaerobic decomposition of organic matter in rice cropping soils and thus reduced generation of methane. The methodology includes projects such as: (a) Rice farms that change the water regime during the cultivation period from continuously to intermittent flooded	Via checking the Ex-ante investigation report/16/ and interview with farmers/15/, local experts/13/ and local officer/12/, CTI confirmed that the technology utilized by project is type (a) Rice farms that change the water regime during the cultivation period from continuously to intermittent flooded conditions and/or a shortened period of flooded conditions	Applicable

No.	Applicability conditions	Validation Assessment	Conclusion
	conditions and/or a shortened period of flooded conditions; (b) Alternate wetting and drying method and aerobic rice cultivation methods (see <http://www.knowledgebank.irri.org/water management>); (c) Rice farms that change their rice cultivation practice from transplanted to direct seeded rice	through the construction of cement ditches for controllable irrigation and drainage by site inspection.	
2	Rice cultivation in the project area is predominantly characterized by irrigated, flooded fields for an extended period of time during the growing season, i.e. farms whose water regimes can be classified as upland or rainfed and deep water are not eligible to apply this methodology. This shall be shown from a representative survey conducted in the geographical region of the proposed project or by using national data. This project area characterization shall also include information on pre-season water regime and applied organic amendments, so that all dynamic parameters as shown in Table 2 are covered by the baseline study.	Via checking the Ex-ante investigation report/16/ and interview with farmers/15/, local experts/13/ and local officer/12/, CTI confirmed that Rice cultivation in the project area is predominantly characterized by irrigated, flooded fields for an extended period during the growing season. Furthermore, this project area characterization also include information on pre-season water regime and applied organic amendments, all dynamic parameters as shown in Table 2 are covered by the baseline study. The representative baseline survey conducted in the geographical region of the proposed project by Anhui Academy of Social Sciences/16/ is verified to confirm this.	Applicable
3	The project rice fields are equipped with controlled irrigation and drainage facilities such that both during dry and wet season, appropriate dry/flooded conditions can be established on the fields	In the proposed project: The rice fields are equipped with controlled irrigation and drainage facilities, thus the intermittently flooded method can be established on the fields. This is verified by site visit and checking the Inspection and Acceptance Report of the project/9/.	Applicable
4	The project activity does not lead to a decrease in rice yield. Likewise, it does not require the farm to switch to a cultivar that has not been grown before	The project only involved in change the water regime during the rice cultivation period that will not lead to a decrease in rice yield and the type of rice planted in this project is very common and no requirement from the project to lead the farm to switch to a cultivar that has not been grown before.	Applicable

No.	Applicability conditions	Validation Assessment	Conclusion
		This is verified by site visit and interview with farmers representative/15/ and checking the Inspection and Acceptance Report of the project/9/.	
5	Training and technical support during the cropping season that delivers appropriate knowledge in field preparation, irrigation, drainage and use of fertilizer to the farmer is part of the project activity and is to be documented in a verifiable manner (e.g. protocol of trainings, documentation of on-site visits). In particular the project proponent is able to ensure that the farmer by himself or through experienced assistance is able to determine the crop's supplemental N fertilization need. The applied method shall assess the fertilizer needs using for example a leaf color chart or photo sensor or testing stripes. Alternatively a procedure to ensure efficient fertilization considering the specific cultivation conditions in the project area backed by scientific literature or official recommendations shall be used.	Via checking the technical training records/25/, CTI confirmed that the appropriate knowledge in field preparation, irrigation, drainage and use of fertilizer has been provided to the farmers in every February since 2018.	Applicable
6	Project proponents shall assure that the introduced cultivation practice, including the specific cultivation elements, technologies and use of crop protection products, is not subject to any local regulatory restrictions	The project only involved in change the water regime during the rice cultivation period by equipped with controlled irrigation and drainage facilities in project area, which is deemed in line with the local regulatory which has been verified by site interview with local officer/12/ and expert/13/ and checking the related laws and regulations/31/.	Applicable
7	Except the case where the default value approach indicated in section 6.1.2 "Emission reductions using IPCC tier 1 approach or default values" is chosen for emission reductions calculations, project proponents have access to infrastructure to measure CH ₄ emissions from reference fields using closed chamber method and laboratory analysis	In the PD, the "Emission reductions using IPCC tier 1 approach or default values" is chosen by PP for ex ante emission reductions calculations, and during site inspection, CTI confirmed that the project proponents have installed infrastructure to measure CH ₄ emissions from reference fields using closed chamber method and laboratory analysis as the monitoring method for the actual emission reductions calculations.	Applicable

No.	Applicability conditions	Validation Assessment	Conclusion
8	Aggregated annual emission reductions of all fields included under one project activity shall be less than or equal to 60 kt CO ₂ equivalent	The project is expected to generate 53,512 tCO₂e annually which is less than or equal to 60 kt CO₂ equivalent. And PP stressed that if the emission reductions monitored during the verification exceeds the threshold, the project proponent will only claim gap of 60,000 tons according to the Applicability of small-scale methodology. This is verified by checking the PD and ER sheet.	Applicable
Conclusion: Methodology AMS-III.AU (Version 04.0) is applicable to the project activity.			

In addition, the project meets the applicability conditions of the applied tool as follow table,
Table 3-3 Assessment of Applicability conditions of methodological tool

Tool	Criteria	Validation Assessment	Conclusion
(a) TOOL 21 “Demonstration of Additionality of Small-scale Project Activities (version 13.1)”	The use of the methodological tool “Demonstration of additionality of small-scale project activities” is not mandatory for project participants when proposing new methodologies. Project participants and coordinating/managing entities may propose alternative methods to demonstrate additionality for consideration by the Executive Board.	The project activity uses “Demonstration of additionality of small-scale project activities” for additionality demonstration, thus this tool is applicable.	Applicable
	Project participants and coordinating/managing entities may also apply “TOOL19: Demonstration of additionality of microscale project activities” as applicable.	Expected ER value is beyond the microscale. Hence not applicable to “TOOL19: Demonstration of additionality of microscale project activities”/37/	N/A
Conclusion: All the relevant methodological tools are applicable to the project activity.			

CAR 09 was raised and successfully closed. Refer to Appendix 4 for detail assessment.

3.3.3 Project Boundary

Based on AMS-III.AU (version 04.0)/34/, the Project boundary for this Project activity includes:

Rice fields where the cultivation method and water regime are changed in the project area in Qianshan City and Taihu County, the spatial extent of the project boundary includes all fields that change the cultivation method and water regime in the context of the project activity.

Via site investigation by GPS device and checking the map of the project area/5/, CTI confirmed that the project boundary is correctly defined in line with the applied methodology.

The main emission sources and gases included in the project boundary are determined as per the applied methodology, GHG sources included and excluded from the project boundary is defined as correct and corresponding to the actual status of the project, via on-site inspection and checking the project design in project implementation program/7/, it is verified that all the relevant sources have been selected. It is concluded that the project boundary and selected sources are correctly justified for the project.

3.3.4 Baseline Scenario

The PD applies the baseline scenario given by section 5.2 of the AMS-III.AU/34/, i.e.

Baseline scenario is the continuation of the current practice e.g. continuously flooded rice cultivation in the project fields without any organic amendment during rice cultivation in the project fields.

Due to the baseline scenario has been given in the applied methodology, there is no need to identify the baseline scenario determined for the project and thus it is verified that identified baseline scenario is justified. Refer to below section for assessment of the project additionality.

3.3.5 Additionality

Due to the project is a small-scale, TOOL 21 “Demonstration of Additionality of Small-scale Project Activities (version 13.1)”/37/ is used to demonstrate the additionality.

Demonstration of additionality has been assessed as below:

Based on the applied methodology, it is verified that no barriers identified that would prevent the baseline scenario prior to the implementation of project as listed above. The step below is used to analyze the additionality of the project by conducting an investment barrier analysis and technical barrier analysis using the related methodological tool.

Investment barrier analysis

The investment barrier analysis is conducted in line with the requirement in the tool, due to the baseline scenario has been determined in the methodology, thus it is confirmed that the baseline scenario is a financially more viable alternative to the project activity would have led to higher emissions. Thus only need to demonstrate the investment barrier of the project scenario. And based on the comparison of the living standard of the 3,713 households involved in the project with the investment put into build the cement ditches, CTI confirmed that in the absence of the project activity, the scenario prior would be existed as no farmers would invest the updated drainage and irrigation system due to the poor living conditions. This is verified by on-site interview with the farmers/15/ and checking the Ex-ante investigation report/16/. Finally, via checking the funds allocation receipts to farmers/17/, it is verified that the project implementer raised fund based on carbon revenue consideration and solved the investment of the project via confirmed by checking the Board meeting minute/13/ and emission reduction purchase agreement/18/.

Technical barrier analysis

The technical barrier analysis is conducted in line with the requirement in the tool, due to the baseline scenario has been determined in the methodology, thus it is confirmed that the baseline scenario is a less technologically advanced alternative to the project activity involves lower risks so would have led to higher emissions, which has been verified by on-site interview with the farmers/15/ and it is confirmed that without this project, farmers would grow rice by old flooding method, although higher emissions would be resulted. For the project activity, due to the low market share of the new technology adopted in project zone in Qianshan City and Taihu County which has confirmed by checking the Ex-ante investigation report/16/, so the project activity faces technical barrier as no farmers have access to advanced technology about

intermittently flooded water regime, which requires regularly drainage and irrigation. This is verified by on-site interview with the farmers/15/ and checking the Ex-ante investigation report/16/.

In conclusion, an explanation to show that the project activity would not have occurred anyway due to at least one of the barriers as listed in the TOOL 21 “Demonstration of Additionality of Small-scale Project Activities (version 13.1)”/37/ have been sufficiently provided, thus the proposed project is additional. CAR 10 was raised and successfully closed. Refer to Appendix 4 for detail assessment.

3.3.6 Quantification of GHG Emission Reductions and Removals

For validation of the estimated GHG emission reductions in the PD/1/ and ER calculation sheet/2/, Further, the validation team has downloaded from the UNFCCC website the applicable version of the CDM methodology and all referenced methodological tools/48/.

Via verify the PD, it is confirmed the calculation of ERs is done as per the applied methodology (AMS-III.AU ver. 04.0) with follow steps listed below.

Baseline emissions:

According to the methodology, the baseline scenario is the continuation of the current practice e.g. continuously flooded rice cultivation in the project fields.

Hence baseline emissions shall be calculated on a seasonal basis using the following formula:

$$BE_y = \sum_s BE_s \quad (1)$$

$$BE_y = \sum_{g=1}^G EF_{BL,s,g} \times A_{s,g} \times 10^{-3} \times GWP_{CH_4} \quad (2)$$

Where:

BE_y	=	Baseline emissions in year y (tCO ₂ e)
BE_s	=	Baseline emissions from project fields in season s (tCO ₂ e)
$EF_{BL,s,g}$	=	Baseline emissions factor of group g in season s (kgCH ₄ /ha per season)
$A_{s,g}$	=	Area of project fields of group g in season s (ha)
GWP_{CH_4}	=	Global warming potential of CH ₄ (tCO ₂ e/tCH ₄)
g	=	Group g, covers all project fields with the same cultivation pattern (G = total number of groups)

Determination of baseline emission factor on reference fields

As per the applied methodology (AMS-III.AU ver. 04.0), Baseline reference fields shall be set up in a way that they are representative of baseline emissions in the project rice fields. For each group of fields with the same cultivation pattern, as defined with the help of Table 2, at least three reference fields with the same pattern shall be determined in the project area. On these fields, measurements using the closed chamber method shall be carried out, each resulting in an emission factor expressed as kgCH₄/ha per season. The seasonally integrated baseline emission factor $EF_{BL,s,g}$ shall be derived as average value from the three measurements for each group.

Via checking the Ex-ante investigation report derived from farmer’s information/16/, CTI confirmed that all the surveyed sampled farmers using the same cultivation pattern (Continuously flooded, No organic amendment, soil pH within project area is larger than 5.5, soil organic carbon within the range between 1-

3% and climate condition is same) as defined with the help of Table 2 in applied methodology, thus only one group was defined for the project to determine the baseline emission factor on reference fields. CAR 07 was raised and successfully closed. Refer to Appendix 4 for detail assessment.

Project emissions:

Project emissions consist of the CH₄ emissions, which will still be emitted under the changed cultivation practice. Due to the optimized N fertilization practice (cf. applicability criteria in paragraph 3(d), N fertilizer control), N₂O emissions do not significantly deviate from the baseline emissions and hence are not considered.

CH₄ emissions from project fields are calculated on a seasonal basis as follows

$$PE_y = \sum_s PE_s \quad (3)$$

$$PE_s = \sum_{g=1}^G EF_{P,s,g} \times A_{s,g} \times 10^{-3} \times GWP_{CH_4} \quad (4)$$

Where:

PE_y = Project emissions in year y (tCO₂e)

PE_s = Project emissions from project fields in season s (tCO₂e)

$EF_{P,s,g}$ = Project emission factor of group g in season s (kgCH₄/ha per season)

Determination of project emission factor on reference fields

As per the applied methodology (AMS-III.AU ver. 04.0), the seasonally integrated project emission factor $EF_{P,s,g}$ shall be determined using measurements on at least three project reference fields that fulfill the same conditions as the baseline reference fields, with the difference that they are cultivated according to the defined project cultivation practice. Project reference fields shall be established close to the baseline reference fields and begin with the growing season at the same time. $EF_{P,s,g}$ is the average of the measurement results from the three reference fields.

The project emission factor on reference fields $EF_{P,s,g}$ will be monitored during the monitoring period.

CAR 08 was raised and successfully closed. Refer to Appendix 4 for detail assessment.

Leakage

According to the methodology, any effects of the project activity on GHG emissions outside the project boundary are deemed to be negligible and do not have to be considered under this methodology.

Emission reductions:

$$ER_s = BE_s - PE_s \quad (5)$$

Where:

ER_s = Emission reductions in season s (t CO₂e)

Ex ante estimation of emission reductions

As per the applied methodology (AMS-III.AU ver. 04.0), for the ex ante estimation of emission reductions, project participants shall either refer to own field experiments or estimate baseline and project emissions with the help of national data or IPCC tier 1 default values for emission and scaling factors. Hence PP has selected IPCC tier 1 default values for emission and scaling factors for ex ante estimation of emission reductions. The approach has been explained and justified in the PD and assessed as below,

Emission reductions using IPCC tier 1 approach or default values

As an alternative to the reference field approach indicated in paragraphs 12, 13, 16 and 17 of the methodology, project participants calculate emission reductions using Option 1, i.e. Using the IPCC tier 1 approach but undertaking measurements to determine baseline emission factors for continuously flooded fields, as per the following formula:

$$ER_y = EF_{ER} \times A_y \times L_y \times 10^{-3} \times GWP_{CH_4} \quad (6)$$

$$EF_{ER} = EF_{BL} - EF_P \quad (7)$$

$$EF_{BL} = EF_{BL,c} \times SF_{BL,w} \times SF_{BL,p} \times SF_{BL,o} \quad (8)$$

$$EF_P = EF_{BL,c} \times SF_{P,w} \times SF_{P,p} \times SF_{P,o} \quad (9)$$

Where:

ER_y	=	Emission reductions in year y (t CO ₂ e)
EF_{ER}	=	Adjusted daily emission factor (kgCH ₄ /ha/day). Alternatively, seasonal emission factor (kg CH ₄ /ha/season) may be determined
A_y	=	Area of project fields in year y (ha)
L_y	=	Cultivation period of rice in year y (days/year). This is not applicable when seasonal emission factor is determined.
GWP_{CH_4}	=	Global warming potential of CH ₄ (t CO ₂ e/t CH ₄) 25 tCO ₂ /tCH ₄ from the Forth Assessment report, GHG Protocol/33/
EF_{BL}	=	Baseline emission factor (kg CH ₄ /ha/day) or (kg CH ₄ /ha/season)
EF_P	=	Project emission factor (kg CH ₄ /ha/day) or (kg CH ₄ /ha/season)
$EF_{BL,c}$	=	Baseline emission factor for continuously flooded fields without organic amendments (kg CH ₄ /ha/day) or (kg CH ₄ /ha/season)
$SF_{BL,w}$ or $SF_{P,w}$	=	Baseline or project scaling factors to account for the differences in water regime during the cultivation period
$SF_{BL,p}$ or $SF_{P,p}$	=	Baseline or project scaling factors to account for the differences in water regime during the pre-season before the cultivation period
$SF_{BL,o}$ or $SF_{P,o}$	=	Baseline or project scaling factors should vary for both type and amount of organic amendment applied

Determine the value of parameter $EF_{BL,c}$

As per the applied methodology (AMS-III.AU ver. 04.0), the baseline emission factor for continuously flooded fields without organic amendments ($EF_{BL,c}$) shall be either determined ex ante prior to the start of the project activity (in this case the ex ante value should be used to calculate emission reduction during the crediting period) or monitored annually (in this case, the ex post values should be used to calculate emissions reduction during the crediting period).

For this project, as stated in the PD, $EF_{BL,c}$ is determined ex ante prior to the start of the project activity. As per the applied methodology (AMS-III.AU ver. 04.0), at least three reference fields shall be chosen in the project area. On these fields, measurements shall be carried out using the closed chamber method in accordance with the guidance on methane measurement in the appendix of the applied methodology.

Via checking the Appendix. Guidelines for measuring methane emissions from rice fields in the applied methodology (AMS-III.AU ver. 04.0), for determine the ex ante value of $EF_{BL,c}$,

Via checking the Report of Measuring Methane Emission Rate of Double-cropping Rice Paddies with Continuously Flooded Method by Closed Chamber in Qianshan and Taihuin 2017 conducted by Institute of Agricultural Engineering, Anhui Academy of Agricultural Sciences/19/, CTI confirmed that the report was carried out by experts from Anhui Agricultural Bureau which is a provincial bureau in the agricultural field and it is confirmed that the experts from this bureau is qualified to implementation of methane measurement in rice fields based on validation team's local expertise. And by checking the report/19/ and interview with the expert from Anhui Academy of Agricultural Sciences /12/, CTI verified that expert gets the qualification and conducted the lab test in line with the requirement in the methodology.

Furthermore, via checking the detailed plan prepared by PP for methane measurements/20/, CTI verified that before the experts conducted the methane measurement in rice fields, PP provided a plan to experts and this plan included the schedule for the field and laboratory measurements, the logistics that are necessary to get the gas samples to the laboratory and a cropping calendar. The plan also included all reference field specific information regarding location and climate, soil, water management, plant characteristics, fertilizer treatment and organic amendments which is in line with the Appendix. Guidelines for measuring methane emissions from rice fields in the applied methodology (AMS-III.AU ver. 04.0).

For the actual methane measurement on the field, the methods are carried out as below table which is verified in line with the Appendix. Guidelines for measuring methane emissions from rice fields in the applied methodology (AMS-III.AU ver. 04.0). See below table for details assessment,

Table 3-4. On the field - technical options for the chamber design

Feature	Conditions	Justification
Chamber material	Option 1: Non-transparent - Commercially available PVC containers or manufactured chambers (e.g. using galvanized iron); - Painted white or covered with reflective material (to prevent increasing inside temperature); - Only suitable for short-term exposure (typically 30 min) followed by immediate removal from the field	Via checking the Report of Measuring Methane Emission Rate of Double-cropping Rice Paddies with Continuously Flooded Method by Closed Chamber in Qianshan and Taihuin 2017 conducted by Institute of Agricultural Engineering, Anhui Academy of Agricultural Sciences/19/ and on-site checked the Chamber, CTI confirmed that the chamber used in this project is fulfill with the material request listed in the applied methodology.
Placement in soil	Option 1: Fixed base - Base made of non-corrosive material and remains in the field for the whole season; - Base should allow tight sealing of the chamber;	Via checking the Report of Measuring Methane Emission Rate of Double-cropping Rice Paddies with Continuously Flooded Method by Closed Chamber in Qianshan and Taihuin 2017 conducted by Institute of Agricultural Engineering, Anhui Academy of Agricultural Sciences/19/ and on-site checked the

	- Base should have bores in the submerged section to allow water exchange between inside and outside; - Base should be installed at least 24 hours before the first sampling	Chamber, CTI confirmed that the chamber used in this project is fulfill with the placement in soil request listed in the applied methodology.
Auxiliaries of chamber	- Thermometer for measuring the temperature inside the chamber; - Fan (battery operated) inside the chamber for mix the inside air during sampling; - Sampling port (rubber stopper placed in a bore of the chamber)	Via checking the Report of Measuring Methane Emission Rate of Double-cropping Rice Paddies with Continuously Flooded Method by Closed Chamber in Qianshan and Taihuin 2017 conducted by Institute of Agricultural Engineering, Anhui Academy of Agricultural Sciences/19/ and on-site checked the Chamber, CTI confirmed that the auxiliaries of chamber used in this project is fulfill with the request listed in the applied methodology.
Basal area	Rectangular or rounded, but has to cover minimum of four rice hills (ca. 0.1 m ² minimum)	Via checking the Report of Measuring Methane Emission Rate of Double-cropping Rice Paddies with Continuously Flooded Method by Closed Chamber in Qianshan and Taihuin 2017 conducted by Institute of Agricultural Engineering, Anhui Academy of Agricultural Sciences/19/ and on-site checked the Chamber, CTI confirmed that the shape and size of chamber used in this project is fulfill with the request listed in the applied methodology.
Height	Option 1: Fixed height Total height (protruding base + chamber) should exceed plant height	Via checking the Report of Measuring Methane Emission Rate of Double-cropping Rice Paddies with Continuously Flooded Method by Closed Chamber in Qianshan and Taihuin 2017 conducted by Institute of Agricultural Engineering, Anhui Academy of Agricultural Sciences/19/ and on-site checked the Chamber, CTI confirmed that the height of chamber used in this project is higher than the plant height that is fulfill with the request listed in the applied methodology.

Table 3-5. On the field – air sampling

Feature	Conditions	Justification
Replicate chambers per plot	Minimum requirement: Three replicate chambers per plot	Via checking the Report of Measuring Methane Emission Rate of Double-cropping Rice Paddies with Continuously Flooded Method by Closed Chamber in Qianshan and Taihuin 2017 conducted by Institute of Agricultural Engineering, Anhui Academy of Agricultural Sciences/19/ and on-site checked the Chambers, CTI confirmed that the three replicate chambers were placed in every plot that is fulfill with the request listed in the applied methodology.

Number of air samples per exposure / data points per measurement	Minimum requirement: Three samples per exposure	Via checking the Report of Measuring Methane Emission Rate of Double-cropping Rice Paddies with Continuously Flooded Method by Closed Chamber in Qianshan and Taihuin 2017 conducted by Institute of Agricultural Engineering, Anhui Academy of Agricultural Sciences/19/, CTI confirmed that there were three samples for every exposure analyzed that is fulfill with the minimum request listed in the applied methodology.
Exposure time	30 minutes	Via checking the Report of Measuring Methane Emission Rate of Double-cropping Rice Paddies with Continuously Flooded Method by Closed Chamber in Qianshan and Taihuin 2017 conducted by Institute of Agricultural Engineering, Anhui Academy of Agricultural Sciences/19/, CTI confirmed that exposure time is 30 minutes that is fulfill with the request listed in the applied methodology.
Daytime of measurement	Morning	Via checking the Report of Measuring Methane Emission Rate of Double-cropping Rice Paddies with Continuously Flooded Method by Closed Chamber in Qianshan and Taihuin 2017 conducted by Institute of Agricultural Engineering, Anhui Academy of Agricultural Sciences/19/, CTI confirmed that measuring time was at morning in daytime is 30 minutes from 9.30 – 10.00 a.m. that is fulfill with the request listed in the applied methodology.
Measurement interval	Minimum requirement: once per week	Via checking the Report of Measuring Methane Emission Rate of Double-cropping Rice Paddies with Continuously Flooded Method by Closed Chamber in Qianshan and Taihuin 2017 conducted by Institute of Agricultural Engineering, Anhui Academy of Agricultural Sciences/19/ and checking the plan/20/, CTI confirmed that measurement interval period is once per week that is fulfill with the minimum request listed in the applied methodology.
Syringe	Suitability test (leak proof) before measurement Preferably equipped with a lock for ease of handling	Via checking the Report of Measuring Methane Emission Rate of Double-cropping Rice Paddies with Continuously Flooded Method by Closed Chamber in Qianshan and Taihuin 2017 conducted by Institute of Agricultural Engineering, Anhui Academy of Agricultural Sciences/19/ and on-site checked the Chambers, CTI confirmed that the syringe with a lock was used in chamber and it is checked for leak proof before every measurement that is fulfill with the request listed in the applied methodology.
Sample storage until analysis	Storage < 24 h: air samples can remain in syringe;	Via checking the Report of Measuring Methane Emission Rate of Double-cropping Rice Paddies with Continuously Flooded Method by Closed Chamber in Qianshan and Taihuin 2017 conducted by Institute of Agricultural Engineering, Anhui Academy of Agricultural Sciences/19/, CTI confirmed that the

	Storage > 24 h: transfer air samples into evacuated vial, store with slight overpressure	three samples were taken before a laboratory analysis was performed, so the samples were stored in the evacuated vials that is fulfill with the request listed in the applied methodology.
--	---	--

Table 3-6. Laboratory analysis

Feature	Conditions	Justification
Method	Gas Chromatograph with flame ionization detector (FID)	Via checking the Report of Measuring Methane Emission Rate of Double-cropping Rice Paddies with Continuously Flooded Method by Closed Chamber in Qianshan and Taihuin 2017 conducted by Institute of Agricultural Engineering, Anhui Academy of Agricultural Sciences/19/, CTI confirmed that the FID is used in laboratory analysis
Injection	Direct injection or with multi-port valve and sample loop	Via checking the Report of Measuring Methane Emission Rate of Double-cropping Rice Paddies with Continuously Flooded Method by Closed Chamber in Qianshan and Taihuin 2017 conducted by Institute of Agricultural Engineering, Anhui Academy of Agricultural Sciences/19/, CTI confirmed that the direct injection method is used in laboratory analysis
Column	Packed (e.g. molecular sieve) or capillary column	Via checking the Report of Measuring Methane Emission Rate of Double-cropping Rice Paddies with Continuously Flooded Method by Closed Chamber in Qianshan and Taihuin 2017 conducted by Institute of Agricultural Engineering, Anhui Academy of Agricultural Sciences/19/, CTI confirmed that the packed column is used in laboratory analysis
Calibration	With certified standard gas each day of analysis before and after the analyses are done	Via checking the Report of Measuring Methane Emission Rate of Double-cropping Rice Paddies with Continuously Flooded Method by Closed Chamber in Qianshan and Taihuin 2017 conducted by Institute of Agricultural Engineering, Anhui Academy of Agricultural Sciences/19/, CTI confirmed that the calibration is conducted as per request of the methodology in laboratory analysis.

Thus via checking the Report of Measuring Methane Emission Rate of Double-cropping Rice Paddies with Continuously Flooded Method by Closed Chamber in Qianshan and Taihuin 2017 conducted by Institute of Agricultural Engineering, Anhui Academy of Agricultural Sciences/19/, CTI verified that the measurement methane results are correct, and based on the “Calculation of the emission rate for a plot (reference field)” in the Appendix. Guidelines for measuring methane emissions from rice fields in the applied methodology (AMS-III.AU ver. 04.0),

The mass of CH₄ emissions for a plot (reference field) is calculated by formular

$$m_{CH_4,t} = c_{CH_4,t} \times V_{chamber} \times M_{CH_4} \times \frac{1atm}{R \times T_t \times 1000} \quad (10)$$

Where:

m_{CH_4}	=	Mass of CH_4 in chamber at time t (mg)
t	=	Point of time of sample (e.g. 0,15,30 in case of three samples within 30 minutes)
$C_{CH_4,t}$	=	CH_4 concentration in chamber at time t , from gas analysis (ppm)
$V_{Chamber}$	=	Chamber volume (L)
M_{CH_4}	=	Molar mass of CH_4 : 16g/mol
1atm	=	Assume constant pressure of 1atm, unless pressure measurement is installed
R	=	Universal gas constant: $0.08206 \text{ L atm/K}^{-1} \times \text{mol}^{-1}$
T_t	=	Temperature at time t (K)

(1) Determine the slope of the line of best fit for the values of over time with the help of Excel:

$$s = \frac{\Delta m_{CH_4}}{\Delta t} \quad (11)$$

Where:

s	=	Slope of line of best fit (mg/min)
-----	---	------------------------------------

(2) Calculate the emission rate per hour for one chamber measurement:

$$RE_{ch} = s \times \frac{60\text{min}}{A_{chamber}} \quad (12)$$

Where:

RE_{ch}	=	Emission rate of chamber ch ($\text{mg/h} \times \text{m}^2$)
ch	=	Index for replicate chamber on a plot
$A_{chamber}$	=	Chamber area (m^2)

(3) Calculate the average emission rate of a chamber measurement per plot:

$$RE_{plot} = \frac{\sum_{ch=1}^{Ch} RE_{ch}}{Ch} \quad (13)$$

Where:

RE_{plot}	=	Average emission rate of a plot ($\text{mg/h} \times \text{m}^2$)
ch	=	Number of replicate chambers per plot

(4) Further procedure: from the average emission rates per plot of each chamber measurement, derive the seasonally integrated emission factor by integration of the measurement results over the season length. The simplest way of integration is multiplying the emission rate with the number of hours of the measurement interval (e.g. one week) and accumulating the

results of every measurement interval over the season. Convert from mg/m^2 to kg/ha by multiplying with 0.01. So, the final integrated results of RE_{plot} with the unit of $(\text{kg}/\text{season}/\text{ha})$ in the three reference fields is equal to $\text{EF}_{\text{BL},c}$ ($\text{kgCH}_4/\text{season}/\text{ha}$) which are summarized in Table 3-7 below.

Table 3-7 RE_{plot} ($\text{kg}/\text{season}/\text{ha}$) in reference fields

Plot No.	Early Season			Second Season		
	RE_{plot} ($\text{mg}/\text{h} \times \text{m}^2$)	Hours over the season	RE_{plot} ($\text{kg}/\text{season}/\text{ha}$)	RE_{plot} ($\text{mg}/\text{h} \times \text{m}^2$)	Hours over the season	RE_{plot} ($\text{kg}/\text{season}/\text{ha}$)
Plot 1	5.91	2,904 hours (121 days)	171.53	6.34	2,592 hours (108 days)	164.29
Plot 2	5.95		172.68	6.57		170.17
Plot 3	6.52		189.40	6.22		161.26
Average	6.12		177.87	6.37		165.24

Hence, based on above calculation process, and via checking the Report of Measuring Methane Emission Rate of Double-cropping Rice Paddies with Continuously Flooded Method by Closed Chamber in Qianshan and Taihuin 2017 conducted by Institute of Agricultural Engineering, Anhui Academy of Agricultural Sciences/19/, it is verified that the baseline emission factor for continuously flooded fields without organic amendments ($\text{EF}_{\text{BL},c}$) is $177.87 \text{ kg CH}_4/\text{ha}/\text{season}$ for early season and $165.24 \text{ kg CH}_4/\text{ha}/\text{season}$ for second season as used in the PD is correct and actual.

Determine the value of parameter $\text{SF}_{\text{BL},w}$ or $\text{SF}_{P,w}$

Via the methodology, the IPCC default values for $\text{SF}_{\text{BL},w}$ or $\text{SF}_{P,w}$ are as following table

Table 3-4. IPCC default values for $\text{SF}_{\text{BL},w}$ or $\text{SF}_{P,w}$

Water regime during the cultivation period		$\text{SF}_{\text{BL},w}$ or $\text{SF}_{P,w}$
Irrigated	Continuously flooded	1
	Intermittently flooded - single aeration	0.60
	Intermittently flooded - multiple aeration	0.52

Via Ex-ante investigation report/16/ and interview with farmer/15/, CTI verified that the water regime is continuously flooded in baseline scenario, and via site inspection and checking the Inspection and Acceptance Report of the project/9/, CTI confirmed that the water regime of this project activity is intermittently flooded with multiple aeration as defined in the methodology, hence $\text{SF}_{\text{BL},w}$ is 1 and $\text{SF}_{P,w}$ is 0.52.

Determine the value of parameter $\text{SF}_{\text{BL},p}$ or $\text{SF}_{P,p}$

Via the methodology, the IPCC default values for $\text{SF}_{\text{BL},p}$ or $\text{SF}_{P,p}$ are as following table

Table 3-5. IPCC default values for $\text{SF}_{\text{BL},p}$ or $\text{SF}_{P,p}$

Water regime during the cultivation period		$\text{SF}_{\text{BL},p}$ or $\text{SF}_{P,p}$
Non flooded pre-season < 180 days (indicating double cropping)		1
Non flooded pre-season > 180 days (indicating single cropping)		0.68

Via checking the Ex-ante investigation report/16/, CTI verified that all the rice cultivation is double cropping in project area, hence $\text{SF}_{\text{BL},p}$ and $\text{SF}_{P,p}$ are 1.

Determine the value of parameter $\text{SF}_{\text{BL},o}$ or $\text{SF}_{P,o}$

Via the methodology, the IPCC default for $\text{SF}_{\text{BL},o}$ or $\text{SF}_{P,o}$ is calculated as follows,

$$SF_o = \left(1 + \sum_i ROA_i \times CFOA_i \right)^{0.59} \quad (14)$$

Where:

- ROA_i = Application rate of organic amendment type i , in dry weight for straw and fresh weight for others, tonne ha⁻¹.
5 tonne/ha of straw is assumed as the baseline quantity of organic amendment, because the value of leftover straw after harvest is in the range of 3 tonne/ha (when harvested manually to the ground level, leaving very little stubble and the root residues) to 7 tonne/ha (harvested mechanically leaving behind large amount of crop residues on the field)
- $CFOA_i$ = Conversion factor for organic amendment type i (in terms of its relative effect with respect to straw applied shortly before cultivation).
0.29 is used for a single crop and 1.0 for a double crop

Via the Ex-ante investigation report/16/, Inspection and Acceptance Report of the project/9/ and interview with farmer/15/, CTI verified that no organic amendments are applied under both baseline and project scenario, so ROA_i is 0 and thus based on above formular, $SF_{BL,o}$ and $SF_{P,o}$ are 1.

In conclusion, based on above values for each parameter for determine the ex ante of emission reduction calculation, the CTI verified that result in PD are correct for the ex ante ER values during the first 7 crediting period.

The estimated amount of GHG emission reductions of the project is 374,584 tCO₂e during the 1st crediting period (7 years) from 24-February-2018 to 23-February-2025, resulting in estimated average annual emission reductions of 53,512 tCO₂e.

The ER calculation sheet/2/ has been duly checked. Further it has been checked whether the results have been correctly calculated in PD for determination of ex-ante ER. The validation team has further checked the PD against the latest version of the applicable methodology for consistency.

CAR 11, CAR 12 and CAR 13 were raised and successfully closed. Refer to Appendix 4 for detail assessment.

3.3.7 Methodology Deviations

There are no any methodology deviations applied to the project.

3.3.8 Monitoring Plan

1. Data and parameters available at validation

Please refer to the following tables for assessment of each parameter determined ex-ante:

A _y	Area of project fields in year y
Title in line with Methodology?	Yes
Data unit correctly expressed?	Yes
Appropriate description?	Yes
Source clearly referenced? (appropriate?)	The source is field measurement, determined by collecting the project field sizes in a project database. The size of project fields are determined by GPS or satellite data.

Correct value provided?	Yes – 12,997 ha Derived from GPS results measured by agricultural bureaus in Qianshan City and Taihu County /6/
Has this value been verified?	Yes. The value has been verified against the data source. And the areas for sampled farmers have been verified by site interview with farmers and measuring by GPS device during site inspection.
Choice of data correctly justified?	Yes
Measurement method correctly described?	N/A

GWP_{CH_4}	Global warming potential of CH_4
Title in line with Methodology?	Yes
Data unit correctly expressed?	Yes
Appropriate description?	Yes
Source clearly referenced? (appropriate?)	The source is <i>Forth Assessment report, GHG Protocol</i> which are appropriate/33/
Correct value provided?	Yes – 25 tCO ₂ e/ tCH ₄
Has this value been verified?	Yes. It is a default value from IPCC/27/. The value has been verified against the data source
Choice of data correctly justified?	Yes
Measurement method correctly described?	Yes, any future revision of the IPCC's assessment report should be taken account.

$EF_{BL,c}$	Seasonal baseline emission factor for continuously flooded fields without organic amendments
Title in line with Methodology?	Yes
Data unit correctly expressed?	Yes
Appropriate description?	Yes
Source clearly referenced? (appropriate?)	The source is Report of Measuring Methane Emission Rate of Double-cropping Rice Paddies with Continuously Flooded Method by Closed Chamber in Qianshan and Taihuin 2017/19/ which is verified as appropriate. Refer to above section “Determine the value of parameter $EF_{BL,c}$ ” for assessment details.
Correct value provided?	Yes – (1) 177.87 kg CH ₄ /ha/season for early season rice; (2) 165.24 kg CH ₄ /ha/ season for later season rice
Has this value been verified?	Yes. The values are verified as correct and calculated as per the applied methodology. Refer to above section “Determine the value of parameter $EF_{BL,c}$ ” for assessment details.
Choice of data correctly justified?	Yes. The justification of choice has been clearly stated in the PD by PP which is verified as in line with the applied methodology.
Measurement method correctly described?	N/A

$SF_{BL,w}$	Baseline scaling factors to account for the differences in water regime during the cultivation period
Title in line with Methodology?	Yes
Data unit correctly expressed?	Yes
Appropriate description?	Yes
Source clearly referenced? (appropriate?)	The source is 2006 IPCC Guidelines for National Greenhouse Gas Inventories/27/ as listed in the applied methodology which is appropriate
Correct value provided?	Yes –1 is adopted due to the rice is cultivated under continuously flooded condition in baseline scenario Refer to above section “Determine the value of parameter $SF_{BL,w}$ or $SF_{P,w}$ ” for assessment details.
Has this value been verified?	Yes. It is a default value from IPCC/27/. The value has been verified against the data source.
Choice of data correctly justified?	Yes
Measurement method correctly described?	N/A

$SF_{P,w}$	Project scaling factors to account for the differences in water regime during the cultivation period
Title in line with Methodology?	Yes
Data unit correctly expressed?	Yes
Appropriate description?	Yes
Source clearly referenced? (appropriate?)	The source is 2006 IPCC Guidelines for National Greenhouse Gas Inventories/27/ as listed in the applied methodology which is appropriate
Correct value provided?	Yes –0.52 is adopted due to the rice is cultivated under intermittently flooded condition in baseline scenario Refer to above section “Determine the value of parameter $SF_{BL,w}$ or $SF_{P,w}$ ” for assessment details.
Has this value been verified?	Yes. It is a default value from IPCC/27/. The value has been verified against the data source.
Choice of data correctly justified?	Yes
Measurement method correctly described?	N/A

$SF_{BL,p}$	Baseline scaling factors to account for the differences in water regime in the pre-season before the cultivation period.
Title in line with Methodology?	Yes
Data unit correctly expressed?	Yes
Appropriate description?	Yes
Source clearly referenced? (appropriate?)	The source is 2006 IPCC Guidelines for National Greenhouse Gas Inventories/27/ as listed in the applied methodology which is appropriate
Correct value provided?	Yes –1 is adopted due to cultivation mechanism in rice field is double cropping in baseline scenario Refer to above section “Determine the value of parameter $SF_{BL,p}$ or $SF_{P,p}$ ” for assessment details.

Has this value been verified?	Yes. It is a default value from IPCC/27/. The value has been verified against the data source.
Choice of data correctly justified?	Yes
Measurement method correctly described?	N/A

$SF_{P,p}$	Project scaling factors to account for the differences in water regime in the pre-season before the cultivation period.
Title in line with Methodology?	Yes
Data unit correctly expressed?	Yes
Appropriate description?	Yes
Source clearly referenced? (appropriate?)	The source is 2006 IPCC Guidelines for National Greenhouse Gas Inventories/27/ as listed in the applied methodology which is appropriate
Correct value provided?	Yes – 1 is adopted due to cultivation mechanism in rice field is double cropping in project scenario Refer to above section “Determine the value of parameter $SF_{BL,p}$ or $SF_{P,p}$ ” for assessment details.
Has this value been verified?	Yes. It is a default value from IPCC/27/. The value has been verified against the data source.
Choice of data correctly justified?	Yes
Measurement method correctly described?	N/A

$SF_{BL,o}$	Baseline scaling factors should vary for both type and amount of organic amendment applied
Title in line with Methodology?	Yes
Data unit correctly expressed?	Yes
Appropriate description?	Yes
Source clearly referenced? (appropriate?)	The source is 2006 IPCC Guidelines for National Greenhouse Gas Inventories/27/ as listed in the applied methodology which is appropriate
Correct value provided?	Yes – 1 is adopted due to no organic amendments are applied under baseline scenario, so ROA_i is 0 and thus based on calculation formula, $SF_{BL,o}$ is 1. Refer to above section “Determine the value of parameter $SF_{BL,o}$ or $SF_{P,o}$ ” for assessment details.
Has this value been verified?	Yes. It is a default value from IPCC/27/. The value has been verified against the data source.
Choice of data correctly justified?	Yes
Measurement method correctly described?	N/A

$SF_{P,o}$	Project scaling factors should vary for both type and amount of organic amendment applied
Title in line with Methodology?	Yes
Data unit correctly expressed?	Yes
Appropriate description?	Yes
Source clearly referenced? (appropriate?)	The source is 2006 IPCC Guidelines for National Greenhouse Gas Inventories/27/ as listed in the applied methodology which is appropriate

Correct value provided?	Yes – 1 is adopted due to no organic amendments are applied under project scenario, so ROA_i is 0 and thus based on calculation formular, $SF_{p,o}$ is 1. Refer to above section “Determine the value of parameter $SF_{BL,o}$ or $SF_{p,o}$ ” for assessment details.
Has this value been verified?	Yes. It is a default value from IPCC/27/. The value has been verified against the data source.
Choice of data correctly justified?	Yes
Measurement method correctly described?	N/A

CAR 14 was raised and successfully closed. Refer to Appendix 4 for detail assessment.

2. Data and Parameters Monitored

The monitoring parameters required by the methodology and applicable tools for the project are summarized in the below table.

$A_{s,g}$	Aggregated project area in a given season s
Title in line with Methodology?	Yes
Ex-ante Value	Not used for ex ante ER calculation
Data unit correctly expressed?	Yes
Appropriate description?	Yes
Source clearly referenced? (appropriate?)	Yes – to determine by collecting the project field sizes in a project database
Correct value provided?	N/A
Has this value been verified?	N/A
Choice of data correctly justified?	Yes – to determine by collecting the project field sizes in a project database which is in line with the applied methodology and only compliant farms are considered
Measurement method correctly described?	Yes – Field measurement. The size of project fields shall be determined by GPS or satellite data. Should such technologies not be available, established field size measurement approaches shall be used provided that uncertainties are taken into account in a conservative manner which is in line with the applied methodology.
Monitoring frequency correctly described?	Every season - verified as per the applied methodology
Monitoring equipment correctly described?	GPS or satellite data - verified as per the applied methodology
QA/QC procedure correctly described?	Yes General guidelines for SSC CDM methodologies will be referred
Purpose of data?	BE_s calculation

$EF_{BL,s,g}$	Baseline emission factor of group g in a given season s
Title in line with Methodology?	Yes
Ex-ante Value	Not used for ex ante ER calculation

Data unit correctly expressed?	Yes
Appropriate description?	Yes
Source clearly referenced? (appropriate?)	Yes - Field measurements in baseline reference fields
Correct value provided?	N/A
Has this value been verified?	N/A
Choice of data correctly justified?	Yes –Field measurements in baseline reference fields as per the applied methodology
Measurement method correctly described?	Yes –Field measurements in baseline reference fields as per instructions in the appendix (Guidelines for measuring methane emissions from rice fields) and IPCC 2006, volume 4, chapter 5.5/27/ as per the applied methodology
Monitoring frequency correctly described?	Obtained from the calculation of the emission rate for baseline reference fields according to the requirements in the Appendix of methodology, and the $C_{CH_4,t}$ (CH_4 concentration in chamber at time t) of weekly gas samplings is derived from the laboratory analysis. Regular measurements as per closed chamber method guidance, seasonally integrated - verified as per the applied methodology
Monitoring equipment correctly described?	Closed chamber and also devices in laboratory - verified as per the applied methodology
QA/QC procedure correctly described?	Yes The implementation of methane measurement in rice fields shall be conducted by technicians trained by experts and the laboratory should get ISO/IEC 17025/26/ certificate. All the data should be cross-checked by technicians and experts. The QA/QC procedure is verified as appropriate and in line with the requirement of Appendix in methodology.
Purpose of data?	BE _s calculation

$EF_{P,s,g}$	Project emission factor of group g in a given seasons
Title in line with Methodology?	Yes
Ex-ante Value	Not used for ex ante ER calculation
Data unit correctly expressed?	Yes
Appropriate description?	Yes
Source clearly referenced? (appropriate?)	Yes - Field measurements in project reference fields
Correct value provided?	N/A
Has this value been verified?	N/A
Choice of data correctly justified?	Yes –Field measurements in project reference fields as per the applied methodology
Measurement method correctly described?	Yes –Field measurements in project reference fields as per instructions in the appendix (Guidelines for measuring methane emissions from rice fields) and IPCC 2006, volume 4, chapter 5.5/27/ as per the applied methodology

Monitoring frequency correctly described?	Obtained from the calculation of the emission rate for baseline reference fields according to the requirements in the Appendix of methodology, and the $C_{CH_4,t}$ (CH_4 concentration in chamber at time t) of weekly gas samplings is derived from the laboratory analysis. Regular measurements as per closed chamber method guidance, seasonally integrated - verified as per the applied methodology
Monitoring equipment correctly described?	Closed chamber and also devices in laboratory - verified as per the applied methodology
QA/QC procedure correctly described?	Yes The implementation of methane measurement in rice fields shall be conducted by technicians trained by experts and the laboratory should get ISO/IEC 17025/26/ certificate. All the data should be cross-checked by technicians and experts. The QA/QC procedure is verified as appropriate and in line with the requirement of Appendix in methodology.
Purpose of data?	PE _s calculation

CAR 15 was raised and successfully closed. Refer to Appendix 4 for detail assessment.

3. Monitoring plan

The validation team has checked the monitoring plan of the PD against the applied methodology. The monitoring plan in the PD has been designed to comply with the latest applicable version of the methodology (AMS-III.AU version 04.0).

Data and parameters to be monitored as above tables are confirmed in line with the methodology, also corresponding to the formula used for ER calculation.

Monitoring process

1) Monitoring of farmers' compliance with project cultivation practice (determination of $A_{s,g}$)

The monitoring plan designed in the PD for monitoring of farmers' compliance with project cultivation practice is checked by validation team, CTI confirmed that the description is in line with the applied methodology.

The project database with all 3,713 participated rice farmer households' identification/15/ including name and address of the rice farmer, size of the field and additional farm specific information have been provided to the validation team, CTI confirmed that the PP has set up a database that allow an unambiguous identification of participating rice farm, and this database will be used as the basis for PP to conduct the sampling method as stated below.

As per the requirement in the applied methodology, a cultivation logbook shall be maintained for all project fields, hence all the 3,713 participated rice farmer households will fill the logbooks as per the requirement in the methodology.

As per the request from the applied methodology, the reporting and verification shall be done on the basis of samples of the log-books from the farmers, according to the latest version of the "Standard for sampling and surveys for CDM project activities and programme of activities" (version 08.0), hence PP has established a sampling method following this standard and the sampling size is verified as correct and PP has used 90/10 confidence/precision as the criteria

for the reliability of sampling efforts for small-scale project activity is deemed as in line with the requirement of the sampling standard/35/.

314 samples will be selected according to stratified sampling method in 9 towns and 2 villages based on the numbers determined for each town calculated by the weight of total farmers numbers of each town in project area.

And then for sample selection of each town, a random sampling method will be used for determine the famers sample in each town and finally the randomly selected 314 samples will be defined.

Then during cultivation season, the selected farmers' logbooks including all parameters that are part of the project cultivation practice at least covering as follow

- (a) Sowing (date),
- (b) Fertilizer, organic amendments, and crop protection application (date and amount);
- (c) Water regime on the field (e.g. "dry/moist/flooded") and dates where the water regime is changed from one status to another,
- (d) Yield
- (e) Whether they have followed fertilization recommendations provided with the introduction of the adjusted water management practice

2) Monitoring of baseline and project emissions (determination of $EF_{BL,s,g}$ and $EF_{p,s,g}$)

For ex post emission reduction calculation, as per the applied methodology AMS-III.AU Version 04.0, and formular listed (1)-(5) of this report, the monitored parameters of $EF_{BL,s,g}$ and $EF_{p,s,g}$ need to be measured as per the instructions in the Appendix (Guidelines for measuring methane emissions from rice fields) of the applied methodology and IPCC 2006, volume 4, chapter 5.5.

Via checking the monitoring plan for the two monitoring parameters listed in the PD, CTI confirmed that the plan is in line with the requirement of the Appendix (Guidelines for measuring methane emissions from rice fields) of the applied methodology. All the requirements in Appendix have been considered by PP in the monitoring plan and CTI confirmed that the monitored parameters of $EF_{BL,s,g}$ and $EF_{p,s,g}$ will be measured correctly and conservatively.

3) Other element of the monitoring plan

The monitoring team will take the overall monitoring responsibility in the whole monitoring process which has been confirmed during the site interview with the representatives from monitoring team which consists of the project proponent/I1/, Shanghai Libra Investment Management Co., Ltd/I6/, technicians/I4/ and experts from the agricultural bureau/I2/.

Also the Shanghai Libra Investment Management Co., Ltd will establish cultivation logbooks template for the farmers to be monitored within the project boundary to collect and record monitoring data which has been confirmed by interview with the monitoring team members. And the final monitoring results will be double-checked by experts of the agricultural bureau. The roles and responsibilities of the project owner and monitoring team has been defined in the monitoring plan and verified as reasonable and achievable.

The determination of project and baseline reference fields and installation of closed chamber will fulfil the requirement in the methodology. Due to the air samples will be analyzed by certified laboratory, hence no calibration of equipment is needed and the certification of the laboratory will be provided during the verification.

The QA/QC procedure is checked and verified by CTI as correct and reasonable, the results will be cross-checked with the agricultural bureau experts. And monitoring equipment will be updated if there are new versions or more efficient monitoring tools available to keep the data more accurate.

Monitoring team will take actions to maintain or will replace the broken chamber if any malfunction, and the monitoring data will be calculated conservatively for emission calculations during the troubleshooting period.

All data files of monitoring will be archived electronically. All the relevant data records will be kept by the Project owner at least two years after the end of the last crediting period of the project activity.

Besides, based on conducted interviews with related personnel the validation team has assessed the feasibility of the monitoring plan.

Based on interview with site personnel and validation team's local and sectoral knowledge, the measurement methods, recording procedures, equipment installation and maintenance and QA/QC procedures described in the monitoring plan are feasible in China and can fully meet the requirements of the methodology. No difficulties are anticipated in implementing the operational and management structure nor the monitoring plan as a whole.

CAR 16 was raised and successfully closed. Refer to Appendix 4 for detail assessment.

3.4 Non-Permanence Risk Analysis

The non-performance risk report/3/ and Risk Calculation Sheet/4/ are provided by PP, the risk assessment was conducted according to the VCS Procedural Document "AFOLU Non-Permanence Risk Tool" (Version 4.0)/39/. PP adopted the Risk Report Short template and combining with the Risk-Report- Calculation-Tool excel sheet.

Each risk category was calculated based on the VCS guidance and the input provided by the PPs. The information was validated and cross-checked through document and literature review, onsite visits of the project area and interviews conducted. Details of the assessment are provided as follow.

Risk factor	Validation findings
Internal risks	
Project Management	The management team includes individuals who have successfully managed projects through validation of GHG credits under the CDM, CCER, VCS Program/48/,/44/,/49/, therefore this mitigation is scored as -2. There is a specific mitigation plan made by project proponent for potential risks to the project, which includes a process for monitoring progress and documenting lessons learned or corrections that may be needed, and incorporating them into project decision-making in future monitoring periods, which has been verified in the Monitoring Manual/22/, therefore this mitigation is scored as -2. Total score is -4.
Financial Viability	According to the project implementation program/7/, 70% of funds are allocated by the government for this project and surplus of 30% is invested by the PP. Project cash flow breakeven point is between 4 years and up to less than 7 years from the current risk assessment from the current risk assessment.

	The cash out of the project is mainly for implementation of the project during the first three years, which has been fully secured by the project proponent and consulting firm. Therefore this mitigation is scored as 0.
Opportunity Cost	The NPV from the baseline scenario is expected to between 20% more than and up to 20% less than project. And project proponent will subsidize a proportion of carbon benefit to farmers in order to ensure the continuation of the management practices during the crediting period which has been confirmed by checking the cooperation agreement signed between the PP and all the involved farmers/11/. Therefore this mitigation is scored as -2.
Project Longevity	Via checking the project approval/8/ and the Inspection and Acceptance Report of the project/9/, it is confirmed that the project longevity is determined as 30 years and the crediting period is selected to be 21 years. Therefore this mitigation is scored as 15.
External risks	
Land Tenure and Resource Access Impacts	Project Approval/8/ and Certification of land rights/10/ is checked, CTI verified that the land of the project belongs to all farmers involved, and the project proponent holds a concession for operating and management of the project which has been verified through the development agreement signed between the PP and all the involved farmers/11/. Therefore this mitigation is scored as 0.
Community Engagement	The land of the project belongs to all farmers involved, no residents living within the project area. All of them have been consulted and they all agreed project through checking the development agreement signed between the PP and all the involved farmers/11/. According to the project approval/8/ and the Inspection and Acceptance Report of the project/9/, it is verified that the project generates net positive impacts on the social and economic well-being of the local communities who derive livelihoods from the project area. Therefore this mitigation is scored as -5.
Political Risk	The project is located in China. According to World Bank Institute's WGI, the six indicators of China are respectively -0.30, 0.30, -0.47, -0.25, -0.39 and -1.59, averaged over the most recent five years, so the mean score is -0.45. Governance Score is -0.45 then the final score is 4. China has an established Designated National Authority under the CDM and has at least one registered CDM Afforestation/Reforestation project, therefore this mitigation is scored as -2. Total Score is 2.
Natural risks	
Fire	Minor. Fire risk is considered as minor due to there are standing water in rice paddies during the cultivation period. Thus, LS= 1 Furthermore, the fire will be strictly controlled by farmers to prevent the fire and minimize the potential effect. Also via checking the Law of the People's Republic of China on Prevention and Control of Air Pollution/30/, it is verified that the rice straw burning is strictly prohibited in project area thus no risk of fire for this project. Therefore the mitigation is scored as 0.5.
Pest and Disease Outbreaks	Insignificant.

	Via interview with the farmers/15/, it is confirmed that the species which is planted within the project area is hybrid rice, which is confirmed has a good pest and disease resistance based on local expert's expertise. LS=1 The yield of rice may would be damaged by insects and disease, but the risk is considered low because it can be prevented by routine overseeing conducted by trained farmers. The biological measures to control pests and diseases will be mainly adopted. The chemical pesticides are allowed to be used only if there is a serious pest problem erupted in the project area, while improper pesticide application would be harmful to natural environment, but the risk is considered low because pesticide will be strictly managed by well-trained farmers and technicians to minimize the potential effect. As the biological measures to control pests and diseases will be mainly adopted, the pesticide application will be limited. Therefore the mitigation is scored as 0.25.
Extreme Weather	Minor There is basically no extreme weather in the project area based on weather reports collected from historic records from local government/50/; LS=1. Therefore the mitigation is scored as 0.25.
Geological Risk	Minor The geological risk such as earthquakes around the project area are mostly low intensity, so the damage will be minor. According to historical records from local government/50/, there is no earthquakes or volcanoes occurred in recent 100 years around the project area as confirmed during the on-site interview with local officer. LS=0. Furthermore, local government will be responsible for the recovery of the rice cultivation if there is an earthquake occurred as confirmed during the on-site visit. Also the farmers and technicians are well trained in local natural risk control to minimize the potential effect. Therefore the mitigation is scored as 0.
Other risks	None is observed.

The overall risk rating according to the applied tool is 10%. The validation team concludes that this risk rating is purely based on the tool cited above, according to VCS requirements.

The risk rating should not be used for any other purpose than retiring VCUs according to the VCS permanence rules. The risk will be reassessed at time of the first verification and with that prior to any issuance of VCUs. The current buffer is subject to change at verification also in line with further guidance from the VCS on this matter.

Hence, in conclusion, CTI verified that the methodology and any referenced tools have been applied correctly to calculate baseline emissions, project emissions, leakage and net GHG emission reductions and removals.

4 VALIDATION CONCLUSION

Shanghai Libra Investment & Management Co., Ltd. has commissioned the CTI to carry out the Verified Carbon Standard (VCS) validation of the project activity Qiantai Adjusted Water Management in Rice Cultivation (VCS ID 2398), with regard to the relevant requirements for VCS Version 4.1.

The review of the project design documentation and the subsequent follow-up interviews have provided CTI with sufficient evidence to determine the fulfilment of stated criteria.

In the course of the validation 16 Corrective Action Requests (CARs), 4 Clarification Requests (CLs) were raised and successfully closed. No Forwarded Action Requests (FARs) was raised.

The review of the project design documentation and additional documents related to baseline and monitoring methodology and subsequent background investigation have provided the CTI with sufficient evidence to validate the fulfilment of the stated criteria.

In detail the conclusions can be summarized as follows:

- the baseline scenario is correctly defined as per the applied methodology and relate tools;
- the project is additional;
- all data and information used for ex-ante calculation of emission reductions is of projected and/or hypothetical nature;
- a reasonable level of assurance has been applied.
- the monitoring plan in the validated PD is as per the applied methodology AMS-III.AU (version 04.0);
- the project has been implemented and operated as per the VCS PD;
- the project complies with the validation criteria for projects set out in VCS Version 4.1;
- The calculation of the ex ante emission reductions is carried out in a transparent and conservative manner, so that the calculated emission reductions of 374,584 tCO₂e are most likely to be achieved within the 1st 7 years crediting period started from 24-February-2018.

The conclusions of this report show, that the project, as it was described in the project description, is in line with all criteria applicable for the validation against the VCS standard Version 4.1 without any qualifications or limitations.

Table 2. CL from this validation

CL ID	01	Section no.	1.2	Date : 30/04/2021
Description of CL				
For the scope of the project, why the project is applicable to AFOLU scope is not clarified as per the VCS standard 4.1.				
Project participant response				Date : 28/05/2021
In the previous version of PD, the scope of the project just be simply claimed. In the latest version, the scope has been demonstrated and explained combined with the actual situation of the project from three points, as required by Appendix 1 in VCS standard, 4.1.				
Documentation provided by project participant				
/1/- version 02				
DOE assessment				Date: 31/05/2021
As per the Appendix 1 Eligible AFOLU project categories in VCS standard Version 4.1/43/, CTI confirmed that the project belongs to one type of AFOLU categories, i.e. Agricultural Land Management (ALM). While eligible ALM activities are those that reduce net GHG emissions on croplands and grasslands by increasing carbon stocks in soils and woody biomass and/or decreasing CO₂, N₂O and/or CH₄ emissions from soils. By checking the project design, CTI confirmed that the project is applicable to one of eligible ALM activities, i.e. Improved Cropland Management (ICM). For ICM, as per the standard, "this category includes practices that demonstrably reduce net GHG emissions of cropland systems by increasing soil carbon stocks, reducing soil N₂O emissions, and/or reducing CH₄ emissions", and through the onsite visit, interviewing the project developer and reviewing the project design, CTI confirmed that the project takes practices to reduce CH₄ emissions of cropland systems by change the water regime during the rice cultivation period from continuously flooded to intermittent flooded condition so as to increase soil carbon stocks, thus CTI verified that the sectoral scope 14: "Agriculture, Forestry, and other Land Use (AFOLU) is applicable to the project. CL 01 is closed.				

CL ID	02	Section no.	1.3	Date : 30/04/2021
Description of CL				
For the eligibility of the project, how the project is eligible under the scope of the VCS Program is not justified as per the VCS standard 4.1.				
Project participant response				Date : 28/05/2021
The eligibility of the project is justified as follows in the latest version of PD. According to the Section 2.1.1 of VCS Standard version 4.1, this project activity meets two of the scopes of the VCS program: 1) The six Kyoto Protocol greenhouse gases; and 3) Project activities supported by a methodology approved under a VCS approved GHG program, unless explicitly excluded under the terms of Verra approval. Accordingly, this project produces methane (CH₄) emission reductions, which is one kind of the six Kyoto Protocol GHGs. Besides, this project activity is supported by the CDM small-scale methodology: Methane emission reduction by adjusted water management practice in rice cultivation which is approved under a VCS approved GHG program – United Nations Clean Development Mechanism and it is not explicitly excluded under the terms of Verra approval. Therefore, this project is eligible under the scope of VCS program				
Documentation provided by project participant				
/1/- version 02				
DOE assessment				Date: 31/05/2021
The PP has described and justified how the project is eligible under the scope of the VCS Program in PD as per the section 2.1.1 of VCS standard Version 4.1. The assessment is provided as below, 1. The project activity generates GHG emission reductions including CH₄ which belong to the six Kyoto Protocol greenhouse gases which belongs to scope 1) of section 2.1.1 of VCS standard Version 4.1. 2. “The scope of the VCS Program excludes projects that can reasonably be assumed to have generated GHG emissions primarily for the purpose of their subsequent reduction, removal or destruction.” Via checking the PD of the project, it is verified that the project is implemented to change the water regime during the rice cultivation period. It changes continuously flooded to intermittent flooded condition during rice cultivation so that to result in reduced anaerobic decomposition of organic matter in rice cropping soils and thus reduced generation of methane, and the additionality is verified as actual, thus there is no assumption of having generated GHG emissions primarily for the purpose of their subsequent reduction, removal or destruction for this project. 3. The VCS Program also excludes some of the project activities under the circumstances indicated in Table 1 of section 2.1.1 of VCS standard Version 4.1, via checking all the excluded project activities in the table, it is verified that this project type is not excluded by the scope of VCS program. In conclusion, the project is eligible to the scope of the VCS Program. CL 02 is closed.				

CL ID	03	Section no.	1.7	Date : 30/04/2021
Description of CL				
The ownership of the project is not clarified clearly, the function of each party involved is not clarified,				
Project participant response				Date : 28/05/2021
During the construction period, Qianshan and Taihu agricultural bureaus were the main manager, with the cooperation and participation of Hefei Luyu Agricultural Technology Co., Ltd. (hereafter referred to as Hefei Luyu), of the construction of ditches and reservoirs, while the local farmers were hired to build the ditches and reservoirs. During the operation period, Hefei Luyu is responsible for supervising technicians to patrol and maintain the ditches and reservoirs. Furthermore, these farmers also have right to authorize Hefei Luyu as a representative of the carbon project owner and Hefei Luyu only has the right to make decisions about the carbon reduction project. However, Hefei Luyu has already sold the carbon project development right to Shanghai Libra. Therefore, Libra leads the development and management of the carbon project, including compiling the monitoring plan, organizing the training,				

etc.	
Documentation provided by project participant	
/1/- version 02	
DOE assessment	Date: 31/05/2021
The section 1.7 of the PD has been checked, and during the on-site visit and checking the business license/12/ of the participant parties, the government approval of the project/8/, and the carbon reduction project cooperation agreement signed between the farmers and Hefei Luyu Agricultural Technology Co., Ltd./11/, CTI verified that the project developer Hefei Luyu Agricultural Technology Co., Ltd. is a privacy company, who is in charge of the integrated implementation and management of the project. The rice paddies and agricultural fields involved in the project was owned by the farmers which has been confirmed by site interview with farmers/15/ and local officer from Agricultural Bureau/12/ and checking the Certification of land rights/10/. The project proponent is responsible for the comprehensive implementation and management of the project and farmers also have right to authorize Hefei Luyu as a representative of the carbon project owner and Hefei Luyu only has the right to make decisions about the carbon reduction project which is confirmed by checking the carbon reduction project cooperation agreement signed between the farmers and Hefei Luyu Agricultural Technology Co., Ltd./11/ and interview with farmers/15/. Furthermore, Hefei Luyu has already sold the carbon project development right to Shanghai Libra which has been verified in the emission reduction purchase agreement/18/, thus Libra leads the development and management of the carbon project. CL 03 is closed.	

CL ID	04	Section no.	1.8	Date : 30/04/2021
Description of CL				
For the project start date, how the determination of project start date in line with the VCS standard 4.1 is not justified.				
Project participant response				Date : 28/05/2021
According to VCS standard, the project start date is the date on which activities that lead to the generation of GHG emission reductions or removals are implemented (e.g., preparing land for seeding, planting, changing agricultural or forestry practices, rewetting, restoring hydrological functions, or implementing management or protection plans). For this project, according to the requirements of the AMS-III.AU methodology applied, an entire cropping season is started from land preparation and the emission reduction calculation is also started this day. So, the project start date is 24-February-2018 when the land preparation was started.				
Documentation provided by project participant				
/1/- version 02				
farmers database/15/				
DOE assessment				Date: 31/05/2021
As per the concept in VCS standard Version 4.1, the project start date of an AFOLU project is the date on which activities that led to the generation of GHG emission reductions or removals are implemented (e.g., preparing land for seeding, planting, changing agricultural or forestry practices, rewetting, restoring hydrological functions, or implementing management or protection plans). The project start date is 24-February-2018 which is verified as the date on which the project land preparation was started. Via checking the farmers database/15/, it is verified that the start date is correct and in line with the VCS standard. CL 04 is closed.				

Table 3.CAR from this validation

CAR ID	01	Section no.	1.1	Date : 30/04/2021
Description of CAR				
The summary description of the project is not complete as below 1. The technical description of project is missing.				

2. Due to the project applied the renewable crediting period, only the total ER value for first 7 years is needed but not total 21 years.	
Project participant response	Date : 28/05/2021
The missing description of the project is added as below in the latest version of PD.	
1. The technical description of project Within the project boundary, every farmers' household owning the paddy fields is regarded as an isolate unit. With the project implementation, the cement ditches, reservoirs and relevant technical training are provided for these farmers to help them conduct the intermittent flooded water regime during rice cultivation, which replaces the traditional continuously flooded method. During rice cultivation, controllable irrigation and drainage according to rice growth requirements can not only save water resources, but also reduce methane emission from soil organic matter under anaerobic conditions (in the flooded state). 2. The implementation of the project is expected to reduce the GHG emissions amounting to 374,584 tCO ₂ e in the first seven-year period, with an average annual GHG emission removal of 53,512 tCO ₂ e. And section 1.10 is also updated accordingly.	
Documentation provided by project participant	
/1/- version 02	
DOE assessment	Date: 31/05/2021
1. The PD is checked as revised, CTI verified that the technology summary description of the project is correct and complete according to the template request. The information and descriptions reported in section 1.1 of the VCS PD/1/ have been checked. Qiantai Adjusted Water Management in Rice Cultivation (hereinafter referred to as the Project) is a Project that change the water regime during the rice cultivation period. It changes continuously flooded to intermittent flooded condition during rice cultivation so that to result in reduced anaerobic decomposition of organic matter in rice cropping soils and thus reduced generation of methane. The Project involves a total acreage of 12,997 ha for double-cropping rice. Via site inspection with rice lands/32/ and interview with farmer representatives/15/, it is confirmed that before the project implementation, the paddy fields is regarded as an isolate unit and the rice was continuously flooded, and with the project, the cement ditches and reservoirs were constructed to conduct the intermittent flooded water regime during rice cultivation. With the replacing of the continuously flooded method by intermittent flooded method, the project solves the problems of excessive water used during rice cultivation and expected to decrease 48% of the CH ₄ emission. 2. The PD is checked as revised, CTI verified that the ER values only calculated in first 7 years of the renewable 21 years crediting period in both section 1.1 and 1.10. CAR 01 is closed.	

CAR ID	02	Section no.	1.11	Date : 30/04/2021
Description of CAR				
For the section 1.11, below findings are issued,				
1. The description of the project is not complete as per the PD template, the special information for the AFOLU project is not provided. 2. The milestone table is not complete, baseline survey, PD published and site visit time are all missing.				
Project participant response				Date : 28/05/2021
All the missing description has been provided in the latest version of PD as follows.				
1. The project is conducted in Qianshan City and Taihui County, with a total population of nearly 586,000 and 570,000 respectively. All the rice paddies belong to the farmers. During the construction period, Qianshan and Taihu Agricultural Bureau was the main manager, with the cooperation and participation of Hefei Luyu, of the construction of ditches and reservoirs, while the local farmers were hired to build the ditches and reservoirs. During the operation period, Hefei Luyu is responsible for supervising technicians to patrol and maintain the ditches and reservoirs. Besides, Hefei Luyu has been fully authorized by all the farmers to act as the carbon project proponent. Also, Hefei Luyu has already sold the project development right to Shanghai Libra				

Investment & Management Co., Ltd (hereafter referred to as Shanghai Libra). So, Shanghai Libra is leading the carbon project development and management, including compiling the Monitoring and Quality Control Manual, organizing the training, etc. Moreover, the local agricultural bureau is responsible for technical training. Farmers are the main operators to practice intermittently flooded water regime and supposed to record the cultivation logbooks. The technicians should carry out monthly inspections according to the requirements of Monitoring and Quality Control Manual. The profit from this carbon reduction project is shared with farmers. The implementation of the project activity generates 53,512 tCO ₂ e/year and contributes to 6 SDGs. This project is not located within a jurisdiction covered by a jurisdictional REDD+ program.	
2. The milestone table has been completed, while the time of baseline survey, PD published and site visit has been added into the table.	
Documentation provided by project participant	
/1/- version 02	
DOE assessment	Date: 31/05/2021
1. The PD is checked as revised, CTI verified that description of the project is complete as per the PD template, the special information for the AFOLU project is provided.	
2. The PD is checked as revised, CTI verified that milestone table is complete, baseline survey, PD published and site visit time are all added.	
Refer to section 3.1 of this report for detail assessment.	
CAR 02 is closed.	

CAR ID	03	Section no.	1.13	Date : 30/04/2021
Description of CAR				
For the section 1.13, the conditions prior to project initiation are not provided completely as per the PD template.				
Project participant response				Date : 28/05/2021
The conditions of type of vegetation and ecosystems prior to the project initiation are provided. Qianshan City is located in the north subtropical climate area. The natural vegetation is mainly deciduous broad-leaved forest, followed by evergreen broad-leaved forest, coniferous forest, mountain meadow and grass. The artificial vegetation is economic forest, timber forest and firewood forest. Timber stands and oak broad-leaved forests are scattered. Forest coverage is 39%. Three different types of vegetation can be classified according to their altitude. The vegetation type in Taihu is the mixed forest belt of deciduous and evergreen broad-leaved in the north subtropics. It is clear that the different forest types are distributed vertically according to the altitude. Chinese fir and masson pine are mainly distributed in the area between 400 and 600 meters above the sea level, while the coniferous forests, like cork oak, acacia oak, coffin trees, etc., are distributed in the area of altitude between 600 and 1000 meters. There are 12 species of rare tree species and 26 species of rare animals under state protection in Qianshan City. In addition, there are 280 kinds of Chinese medicinal materials such as magnolia officinalis, Poria cocos, sophora flavescens, etc. The northwest of Taihu County is mountainous and the southeast is hilly. In the middle part of the county, there is an artificial lake, named Hualiang Ting reservoir (also known as Hua Ting Lake). There is a natural lake in the south - Po Lake. Whether in the mountains, hills, lakes, there are rich plant and animal resources. According to the statistics of forest resources survey, the forestry land area of the whole county is 1.5833 million mu, and the forest land area is 1.1894 million mu, among which the timber forest is 1.1501 million mu. Meanwhile, the total stock volume of living trees is 529,900 cubic meters, and that of forest trees is 430,800 cubic meters, including 437,900 cubic meters of timber forest Besides, this project does not affect the environmental conditions, including climate, hydrology, topography, soils, relevant historical conditions, type of vegetation, ecosystems, etc., so, the present and prior environmental conditions of this project are the same, which are listed in Section 1.13 of PD.				
Documentation provided by project participant				
/1/- version 02				
Ex-ante investigation report/16/				

DOE assessment	Date: 31/05/2021
The PD is checked as revised. Due to the project is an AFOLU project, the appropriate information on the climate, hydrology, topography, relevant historic conditions, soils, vegetation and ecosystems including the present and prior environmental conditions of the project area has been provided in PD as assessed as correct and actual via site inspection and checking the public information and checking the Ex-ante investigation report/16/of the project area and also cross-checked by interview with local officer/12/, agricultural experts/13/ and local farmers/15/. CAR 03 is closed.	

CAR ID	04	Section no.	1.14	Date : 30/04/2021
---------------	-----------	--------------------	-------------	--------------------------

Description of CAR

For the section 1.14,

1. The project belongs to agricultural industry, however the laws and regulation provided are not totally relevant.
2. How the construction of the project in line with the laws and regulations is not specified.

Project participant response	Date : 28/05/2021
-------------------------------------	--------------------------

1. Some regulations related to agricultural industry has been provided as follows in the latest version of PD.
 - - National Master Plan for High Standard Farmland Construction
 - - National Plan for the Construction of High Standard Farmland for Comprehensive Agricultural Development
 - - Guidance on the National Demonstration Project of High Standard Farmland Construction Comprehensive Agricultural Development
 - - Construction Standard of National Agricultural Comprehensive Development of High Standard Farmland Construction Demonstration Project (Trial) (National Agricultural Office [2009] No.163)
 - - Design Specification for Irrigation and Drainage Engineering (GB50288-1999)
 - - Technical Specification for Water-saving Irrigation Engineering (GB/T50363-2006)
2. According to the Inspection and Acceptance Report of the project, during the construction of cement ditches, the requirements of Design Specification for Irrigation and Drainage Engineering (GB50288-1999) and Technical Specification for Water-saving Irrigation Engineering (GB/T50363-2006) have been followed, which requires no harm to the surrounding soils. Besides, the construction of high standard farmland also followed the requirements of PRC Agricultural Law, National Master Plan for High Standard Farmland Construction, National Plan for the Construction of High Standard Farmland for Comprehensive Agricultural Development, and Guidance on the National Demonstration Project of High Standard Farmland Construction Comprehensive Agricultural Development, without causing negative impact on the local ecological environment. Besides, the project will be subject to regular inspection by local government during the implementation period to ensure continuous compliance.

Documentation provided by project participant

/1/- version 02

Laws and regulations/31/

Inspection and Acceptance Report /9/

Project approval /8/

DOE assessment	Date: 31/05/2021
-----------------------	-------------------------

1. The PD is checked as revised, CTI verified that the PD has stated that the project is in the field of agriculture, the rice cultivation and flooding is confirmed as in line with the laws and regulations as listed in the PD/31/.
2. For the construction during the construction period, via checking the Inspection and Acceptance Report of the project/9/, it is verified that the construction is in line with the requirement of national laws and regulations as stated in the Inspection and Acceptance Report of the project/9/. Also the project is legally approved by Local government by checking the project approval/8/, which means that the project is in line with the national and local laws and regulations based on the local

expertise of the VVB. And as stated in the PD and confirmed by interview with local officer/I2/, CTI verified that the project will be subject to regular inspection by local government during the implementation period to ensure continuous compliance. In conclusion, the project complies with all relevant local, regional and national laws, statutes and regulatory frameworks in China. CAR 04 is closed.

CAR ID	05	Section no.	2.1	Date : 30/04/2021
Description of CAR				
For the section 2.1, the potential negative environmental and socio-economic impacts listed in the table is not relevant due to the project implementation.				
Project participant response				Date : 28/05/2021
All the potential negative environmental and socio-economic impacts listed in the table has been revised as follows.				
1. Environmental impacts a. During the construction, a large amount of construction waste could be generated. b. During the construction, the construction dust could be produced. 2. Socio-economic impacts a. The construction of the project needs to be jointly funded by local farmers and the government, so it would put economic pressure on them, especially farmers. If the intermittently flooded method cannot be conducted strictly during rice cultivation within the project area, then the yield would not be great and the income will not be increased.				
Documentation provided by project participant				
/1/- version 02				
DOE assessment				Date: 31/05/2021
The PD is checked as revised, CTI verified that the potential negative environmental and socio-economic impacts relevant due to the project implementation have been listed. Refer to section 3.2.1 of this report for detail assessment. CAR 05 is closed.				

CAR ID	06	Section no.	2.2	Date : 30/04/2021
Description of CAR				
For the section 2.2, the following finding are issued, 1. The 100 stakeholders' background information need to be provided. 2. The mechanism for on-going communication with local stakeholders is not provided. 3. The description of the communication is not complete as per the PD template, the special information for the AFOLU project is not provided.				
Project participant response				Date : 28/05/2021
All the missing information has been provided in the latest version of PD as follows. 1. The 100 stakeholders' background information has been provided as table in the latest version of PD, including the nationality, educational level, career, gender and age-bracket. 2. The mechanism for on-going communication with local stakeholders is provided as follows. There is a Suggestion Book published with the phone number of contact person on the notice board in each of villages throughout the lifetime of the project. Stakeholders can write their comments or suggestions in the book anytime anonymously as they wish. The project proponent will check the book regularly and collect all the comments received. Besides, the technicians as the project monitoring executor have surveyed the project area. The distance from one village to another is so short that the locals can talk directly to the technicians or even the local agricultural bureaus if they have any opinions. Meanwhile, technicians would also pay a regular visit to the villages and collect comments if any. 3. In the project planning phase, the villagers have been communicated about the design, implementation, the potential risks, costs, and benefits of the project through villagers' meetings. Also, the representative of Hefei Luyu, under the supervision of the local agricultural bureau and				

government, has also informed farmers of all relevant laws and regulations covering workers' rights in the host country. The process of VCS Program validation and verification and the validation/verification body's site visit should be required to inform the farmers by publishing it on the notice board also with the contact person's information. If there is any negative feedback, a meeting will be immediately held in the village.	
Documentation provided by project participant	
/1/- version 02 Questionnaires/23/	
DOE assessment	Date: 31/05/2021
The PD is checked as revised, CTI verified that 1. The 100 stakeholders' background information has been provided. 2. The mechanism for on-going communication with local stakeholders is provided. 3. The description of the communication is complete as per the PD template, the special information for the AFOLU project is provided. Refer to Section 3.2.2 of this report for detail assessment. CAR 06 is closed.	

CAR ID	07	Section no.	2.3	Date : 30/04/2021
Description of CAR				
For the section 2.3, the summary of any environmental impact assessments carried out with respect to the project is not provided.				
Project participant response				Date : 28/05/2021
According to the Environmental Impact Assessment Law of the People's Republic of China, this project does not require any environmental impact assessments. The environmental impacts, both positive and negative, produced during construction and operation of this project activity and the mitigation of negative impact are summarized as table in the latest version of PD.				
Documentation provided by project participant				
/1/- version 02 Anqing Municipal Construction Waste Disposal Management Measure/29/				
DOE assessment				Date: 31/05/2021
The PD is checked as revised, CTI verified that the summary of any environmental impact assessments carried out with respect to the project is provided. In China, according to Chinese law "Environmental Impact Assessment Law of the People's Republic of China", it is confirmed that there is no requirement from any environmental impact assessments to the type of the project. Hence the analysis of the environmental impacts of the project activity is sufficiently described by PP in the PD. The assessment is as below, Associated with the interview with local experts and farmers, there was no adverse effect on the ecology, air, water and solid waste, for the project subject to the implementation of pollution mitigation measures during construction period according to the requirements of Anqing Municipal Construction Waste Disposal Management Measure/29/. There are no any negative impacts found in the project location during the project implementation. As per interview with local officer, it is confirmed that the inspectors from construction entity have to carry out supervision work for the environmental impact arisen from the project activity during construction period, made the wastes were uniformly classified and collected and kept water sprayed frequently to reduce dusts. Via interview with the famers/15/, it is confirmed that they are satisfactory with the environmental protection work carried out. In conclusion, there were some negative impacts on environment during the construction period which has been demonstrated in the PD, also the proper measurements have been carried out by project implementer to mitigate such impacts. And by site inspection of implementation, it is confirmed that there are no obvious negative impacts during the implementation period only if the ditches would be damaged that may impact the water resources, however, with the proper measurements, this situation is unlikely to happen.				

In conclusion, both positive and negative impacts to the environment from the project has been demonstrated and verified as actual and reasonable and there are no significant negative impacts to the environment were identified.
CAR 07 is closed.

CAR ID	08	Section no.	2.5	Date : 30/04/2021
Description of CAR				
For the section 2.5, the following finding are issued,				
- The potential risks and measures are not related to the project implementation. - The descriptions of the risks to local stakeholder resources and processes to ensure ongoing communication are not provided as per the PD template. - The special information for the AFOLU project is not provided as per the PD template.				
Project participant response				Date : 28/05/2021
- The potential risks and measures are edited as follows. The potential risks During the implementation of the project, since it is necessary to go to the field every day to observe the growth of rice and the change of water level, drainage and irrigation are carried out from time to time, which increases the chances of farmers encountering dangers, such as slipping while checking the rice in the field. The measures All these potential risks should be told to the stakeholders in advance and some simple first aid measures also need to be communicated to farmers during training to reduce the injuries. - Prior to the project implementation, these soil ditches cannot be controlled by irrigation and drainage, so rice has to be cultivated under the conditions of continuously flooded method, which leads to a lower productivity and the poor income of local farmers. After the construction of the cement ditches, farmers volunteered to conduct intermittent flooded water regime, because it allowed them to irrigate and drain the rice according to its growth needs, resulting in higher yields. Besides, the 12,997 ha of construction land within the project has been agricultural land since 2005, which has been proved by Qianshan and Taihu Agricultural Bureau. In addition, this project activity only adjusts the water regime during rice cultivation but not changes the type of land use, therefore, the project would not impact local stakeholder's property rights without the free, prior and informed consent. Feedback and Grievance Redress Procedure If there is a conflict of interest between the parties, the stakeholders can appeal to the local agricultural bureau through the village representative or directly, which is the most effective way to solve the problem. They appeal through the phone number of the relevant contact or file a complaint during the meeting. The project proponent has appointed a staff member to record and collect conflicts and dissatisfaction between local communities and individual villagers. Technicians' monthly inspection play an important role in dealing with conflicts and dissatisfaction and report to the agricultural bureau. Upon receipt of the technicians' report, the relevant management unit should contact and discuss with the relevant community or other stakeholders within 3 days. Based on the information collected by the relevant parties, the specific staff member shall propose a solution and mediation plan within one week and solve the conflict within 30 days.				
Documentation provided by project participant				
/1/- version 02 Project approval/8/ Funds allocation receipts/17/ Suggestion Book/24/				
DOE assessment				Date: 31/05/2021
The PD is checked as revised, CTI verified that the The PD states the overall risks to the stakeholders are low, no major risks have arisen that may cause any loss of project benefits for the local community, climate and biodiversity, so that the long-term viability is assured.				

2. The PD states the overall risks to the stakeholder resources are low, no major risks have arisen that may cause any loss of project benefits for the local community, climate and biodiversity, so that the long-term viability is assured. Before the project implementation, the PP has got all the agreements from involved farmer as confirmed by checking the approval/8/ and checking the funds allocation receipts to farmers/17/ and interviewed with local farmers/15/, hence it is verified that project will not impact local stakeholder's property rights without the free, prior and informed consent.
3. The PD describes a feedback and grievance redress process; a specific staff in charge of recording and collecting conflicts and grievances of local communities and individual villagers was nominated who is the first responsible for responding to requests from the community which has been confirmed during on-site interview with the project owner. In addition, by interview with the residents, they confirm that they can either appeal through village representatives or directly to the local forestry bureau for their comments to the project. PP promised that grievances will be addressed in a reasonable amount of time, usually contacted and discussed with relevant community within 3 days, answered and proposes a solution within 1 week in case of claims or complaints and dealt within 30 working days in case of suggestions. The PP declares to be available to adjust the grievance mechanism according the recorded dynamics and evaluation of effectiveness of the process in place. For the project implementation, via site inspection checking the Suggestion Book published on the notice board of villages/24/, it is confirmed that there was no comments or suggestions in the book during the implementation period since 2018, and via interview with PP, it is verified that they will check the book regularly and collect all the comments received.

In conclusion, the feedback and grievance procedure is properly addressed.

CAR 08 is closed.

CAR ID	09	Section no.	3.2	Date : 30/04/2021
Description of CAR				
For the section 3,2, the following finding are issued,				
1. Justification of project scope is missing as per the applied methodology. 2. How the project is applicable to the applied methodology is not clearly justified especially for d), e), f) and g). 3. The justification of the applicability to the TOOL 21“Demonstration of Additionality of Small-scale Project Activities (version 13.1)” is not provided.				
Project participant response				Date : 28/05/2021
1. The scope is provided as the condition according to the applied methodology. This project activity realized the type (a), changing the water regime during the cultivation period from continuously to intermittent flooded conditions, through the construction of cement ditches for controllable irrigation and drainage 2. For the requirement d), e), f) and g) in the applied methodology, the applicability of this project is shown as follows. d) By now since the project activity was started in 2018, experts from Anhui Academy of Agricultural Sciences will train technicians in intermittent irrigation, requiring correct drainage and irrigation at the corresponding stages during rice planting. Every February from 2018, farmers are also trained intensively. During the training, it will be emphasized that the application amount of fertilizer should not exceed the recommended amount for Qianshan City and Taihu County by Anhui Academy of Agricultural Sciences, which is 9-10.5kg/mu. e) The intermittent flooded water regime, the optimal amount of nitrogen utilization and the high standard farmland construction introduced in the project area are legal. f) For the ex ante emission reduction calculation, since “Emission reductions using IPCC tier 1 approach or default values” is chosen for emission reductions calculations, project proponent has already set the closed chamber in the reference fields and made the plan of monitoring made measurements by using the closed chamber to determine baseline emission factors for continuously flooded field. For the post-emission reduction calculation, project proponent has already set the closed chamber in baseline and project reference fields respectively, and made				

the plan of monitoring.	
g) Those rice paddies belong to the local farmers, covering a total of 12,997 hectares, and 53,512 tCO ₂ e is expected to be generated every year, which is below 60 kt CO ₂ e. If the emission reductions monitored during the verification exceeds the threshold, the project proponent will only claim gap of 60,000 tons according to the Applicability of small-scale methodology.	
3. The justification of the applicability to the TOOL 21“Demonstration of Additionality of Small-scale Project Activities (version 13.1)” is provided as follows in the latest version of PD.	
Conditions required by methodology	Applicability of this project
4. The use of the methodological tool “Demonstration of additionality of small-scale project activities” is not mandatory for project participants when proposing new methodologies. Project participants and coordinating/managing entities may propose alternative methods to demonstrate additionality for consideration by the Executive Board.	For this project activity, this methodological tool is decided to be used. Besides, Hefei Luyu (as the project participant) and Shanghai Libra (as the project managing entities) do not plan to propose alternative methods.
5. Project participants and coordinating/managing entities may also apply “TOOL 19: Demonstration of additionality of microscale project activities” as applicable.	This project activity is expected to generate 53,512 tCO ₂ e/ha emission reductions per year which is greatly more than 24 tCO ₂ e/ha defined under microscale project activities, so it is not applicable to “TOOL 19”.
Documentation provided by project participant	
/1/- version 02	
DOE assessment	Date: 31/05/2021
1. The PD is checked as revised, CTI verified that the applicability analysis of project scope is added. 2. The PD is checked as revised, CTI verified that the applicability analysis of the project is applicable to the applied methodology is clearly justified for d), e), f) and g). 3. The PD is checked as revised, CTI verified that the justification of the applicability to the TOOL 21“Demonstration of Additionality of Small-scale Project Activities (version 13.1)” is provided. Refer to section 3.3.2 of this report for detail assessment. CAR 09 is closed.	

CAR ID	10	Section no.	3.5	Date : 30/04/2021
Description of CAR				
For the section 3,5, the following finding are issued,				
1. How the additionality of the project is demonstrated in line with the TOOL 21“Demonstration of Additionality of Small-scale Project Activities (version 13.1)” is not demonstrated. 2. The analysis of investment barrier is not in line with the tool and actual data is not provided for comparison with supporting sources. 3. The analysis of technical barrier is not in line with the tool. 4. If the project is additional is not concluded.				
Project participant response				Date : 28/05/2021
1. The additionality of the project is demonstrated in line with the TOOL 21“Demonstration of Additionality of Small-scale Project Activities (version 13.1)” as follows in the latest version of PD. According to TOOL 21 “Demonstration of Additionality of Small-scale Project Activities (version 13.1), project participant shall provide an explanation to show that the project activity would not have occurred anyway due to at least one of the following barriers: a) Investment barrier: a financially more viable alternative to the project activity would have led to higher emissions; b) Technological barrier: a less technologically advanced alternative to the project activity involves lower risks due to the performance uncertainty or low market share of the new technology adopted for the project activity and so would have led to higher emissions;				

c) Barrier due to the prevailing practice: prevailing practice or existing regulatory or policy requirements would have led to implementation of a technology with higher emissions;

d) Other barriers: without the project activity, for another specific reason identifies by the project participant, such as institutional barriers or limited information, managerial resources, organizational capacity, financial resources, or capacity to absorb new technologies, emissions would have been higher.

Project activity would not have occurred due to investment barrier and technological barrier as analyzed below.

2. The analysis of investment barrier and the actual data is provided as follows.

- Investment barrier

In the absence of the project activity, the living standard of farmers in Qianshan City and Taihu County is poor and the economy is not good enough, so it is difficult for them to build the cement ditches for timely drainage and irrigation according to the growth need of rice. According to implementation plan, the government shall invest 3,500 CNY/ha of irrigation and drainage ditches for the construction of high standard farmland, while the farmers should raise no less than 20% of the government's investment, that is, nearly 700 CNY/ha. According to the results of investigation report, the living balance of local farmers is only 279 CNY/year and 364 CNY/year in Qianshan and Taihu. Therefore, without external investment, farmers cannot afford the economic pressure of self-financing part to build the cement ditches, which could result in continuation of continuously flooded water regime during rice cultivation. So, the baseline scenario is a financially more viable alternative to the project activity but would have led to higher emissions.

3. The analysis of technological barrier is provided as follows.

- Technological barrier

The original water regime used during rice cultivation in baseline scenario, continuously flooded method, is less technologically advanced, because it only requires that the fields should be flooded throughout the whole season and there is no need to pay close attention to the growth status of rice for appropriate drainage and irrigation. Thus, simple soil ditches are enough in baseline scenario so that 97.4% famers in Qianshan City and 97.3% farmers within the project zone practiced continuously flooded method during rice cultivation, which means the new technology, intermittent flooded water regime, has a low market share.

4. The project is additional is included as follows.

In general, this project has both investment and technological barriers, so it is additional.

Documentation provided by project participant

/1/- version 02

DOE assessment

Date: 31/05/2021

The PD is checked as revised, CTI verified that

1. The additionality of the project is demonstrated in line with the TOOL 21 "Demonstration of Additionality of Small-scale Project Activities (version 13.1)".
2. The analysis of investment barrier is in line with the tool and actual data is provided for comparison with supporting sources.
3. The analysis of technical barrier is in line with the tool.
4. The project is additional is concluded.

Refer to section 3.3.5 of this report for detail assessment.

CAR 10 is closed.

CAR ID	11	Section no.	4.1	Date : 30/04/2021
Description of CAR				
For the section 4.1,				
1. How the group of the project is defined is not specified as per the methodology. 2. Description of Determination of baseline emission factor on reference fields is not provided as per the methodology.				
Project participant response				Date : 28/05/2021
1. The group of the project is defined as follows.				

In this project, all the dynamic and statistic parameters of rice paddies within the project area are the same, according to the ex ante investigation report, which can be summarized as follows.			
No.	Parameter	Type	Conditions within the project area
1	Water regime – on-season	Dynamic	Continuously flooded
2	Water regime – pre-season		Flooded
3	Organic amendment		No organic amendment
4	Soil pH	Static	The soil pH within project area is 5.5~7.4, which is in the range of larger than 5.5.
5	Soil organic carbon		The soil organic carbon is 2.53% which is in the range between 1% and 3%.
6	Climate		According to the Rice Almanac (Third Edition, 2002), the project zone, Qianshan City and Taihu County, lies in agroecological zones 7 (AEZs), which is warm/cool humid subtropics with summer rainfall.

Therefore, all fields within project area have the same cultivation pattern and there is only one group in this project.

2. The description of determination of baseline emission factor on reference fields is provided according to the methodology as follows.

1) Baseline reference fields shall be set up in a way that they are representative of baseline emission in the project rice fields. For each group of fields with the same cultivation pattern, as defined with the help of Table above, at least three reference fields with the same pattern shall be determined in the project area. On these fields, measurements using the closed chamber method shall be carried out, each resulting in an emission factor expressed as kgCH₄/ha per season. The seasonally integrated baseline emission factor EF_{BL,s,g} shall be derived as average value from the three measurements for each group.

Documentation provided by project participant	
/1/- version 02	
DOE assessment	Date: 31/05/2021

The PD is checked as revised, CTI verified that

1. How the group of the project is defined is specified as per the methodology.

2. Description of Determination of baseline emission factor on reference fields is provided as per the methodology.

Refer to section 3.3.6 of this report for detail assessment.

CAR 11 is closed.

CAR ID	12	Section no.	4.2	Date	30/04/2021
Description of CAR					
For the section 4.2, description of Determination of project emission factor on reference fields is not provided as per the methodology.					
Project participant response					Date : 28/05/2021
Determination of project emission factor on reference fields is added in PD.					
The seasonally integrated project emission factor EF _{P,s,g} shall be determined using measurements on at least three project reference fields that fulfil the same conditions as the baseline reference fields, with the difference that they are cultivated according to the defined project cultivation practice. Project reference fields shall be established close to the baseline reference fields and begin with the growing season at the same time. EF _{P,s,g} is the average of the measurement results from the three reference fields. There is only one group for all rice paddies in this project, so a total of three project reference fields were established about 1.5km away from the baseline reference fields and began with the growing season at the same time.					
Documentation provided by project participant					
/1/- version 02					
DOE assessment					Date: 31/05/2021

The PD is checked as revised, CTI verified that description of Determination of project emission factor on reference fields is provided as per the methodology.
Refer to section 3.3.6 of this report for detail assessment.
CAR 12 is closed.

CAR ID	13	Section no.	4.4	Date : 30/04/2021
Description of CAR				
For the section 4.4,				
- For ex ante estimation of ER, process for determination of $EF_{BL,c}$ is not completely in line with the requirement of the Appendix in applied methodology. - For determination of $SF_{BL,p}$ and $SF_{P,p}$, how to prove the rice cultivation is double cropping as per the requirement of methodology "For regions/countries where it can be demonstrated by official government data or peer-reviewed literature that double cropping is practiced" is not specified. - For determination of $SF_{BL,o}$ and $SF_{P,o}$, the value is not calculated as per the formular in the methodology and the values of two parameters are not correct. - For the information summarized table, L_y, $SF_{BL,o}$ and $SF_{P,o}$ are missing.				
Project participant response				Date : 28/05/2021
- According to the guidance on methane measurement in the appendix of AMS-III.AU Methodology, the following requirements should be met. The implementation of methane measurement in rice fields requires the involvement of experts in this field or at least experienced staff trained by experts (i.e. from research institutions). These guidelines cannot replace expertise in setting up chamber measurements. They rather set minimum requirements that serve for standardizing the conditions under which methane emissions are measured for projects under this methodology. The closed chamber measurement requires the involvement of technicians trained by experts from Anhui Academy of Agricultural Sciences under the jurisdiction of the Anhui Agricultural Bureau. Anhui Academy of Agricultural Sciences is a comprehensive agricultural research institution directly under the provincial government. The expert who is the leader of the experiment has a doctoral degree and her field of study is rice cultivation and GHG monitoring. The expert set up the chamber measurements on 5 March 2017 for the early season and 12 July 2017 for the second season, respectively. The base is embedded just before transplanting, and the first gas sampling began on the second day after transplanting, followed by sampling every 7 days. After sampling, the gas is stored in the evacuated vial, and the samples collected after three times should be taken together for laboratory analysis. Project proponents shall prepare a detailed plan for the seasonal methane measurements before the start of the season. The plan shall include the schedule for the field and laboratory measurements, the logistics that are necessary to get the gas samples to the laboratory and a cropping calendar. The plan shall also include all reference field specific information regarding location and climate, soil, water management, plant characteristics, fertilizer treatment and organic amendments. - For determination of $SF_{BL,p}$ and $SF_{P,p}$, the ex ante investigation report of Qianshan City and Taihu County in 2017 from Anhui Academy of Social Sciences is used to demonstrate that the rice cultivation is double cropping within the project area. - Accordingly, since no amendments are applied under both baseline and project scenario, $SF_{BL,o}$ and $SF_{P,o}$ are calculated as follows according to the Methodology. $SF_o = \left(1 + \sum_i ROA_i \times CFOA_i \right)^{0.59}$ There are no organic amendments applied under both baseline and project scenario, so $ROA_i=0$ and both $SF_{BL,o}$ and $SF_{P,o}$ are 1. - For the information summarized table, L_y, $SF_{BL,o}$ and $SF_{P,o}$ have been added in the latest version of PD.				
Documentation provided by project participant				

/1/- version 02	
DOE assessment	Date: 31/05/2021
The PD is checked as revised, CTI verified that 1. Process for determination of $EF_{BL,c}$ is completely in line with the requirement of the Appendix in applied methodology for ex ante estimation of ER. 2. The rice cultivation is proved as double cropping as per the requirement of methodology "For regions/countries where it can be demonstrated by official government data or peer-reviewed literature that double cropping is practiced". 3. The value is calculated as per the formular in the methodology and the values for determination of $SF_{BL,o}$ and $SF_{P,o}$, are correct. 4. L_y, $SF_{BL,o}$ and $SF_{P,o}$ are added into the information summarized table. Refer to section 3.3.6 of this report for detail assessment. CAR 13 is closed.	

CAR ID	14	Section no.	5.1	Date : 30/04/2021
Description of CAR				
For the section 5.1, the following findings are issued, 1. Due to there is no Data and Parameters Available at Validation listed in the methodology, the explanation of why some parameters are listed in this section is not provided. 2. For A_y, source of data is not in line with the methodology, and how the data is measured is not specified. 3. For GWP_{CH4}, measurement methods and procedures applied is provided as per VCS standard 4.1. 4. For $EF_{BL,c}$, justification of choice of data is not in line with the requirement of the methodology related to ex ante determination of this parameter. 5. Parameters of $SF_{BL,o}$ and $SF_{P,o}$ are missing.				
Project participant response				Date : 28/05/2021
1. The explanation has been provided in the latest version of PD as follows. According to the methodology, there is no pre-determined data, as long as the monitoring data, but the ex ante calculation method was used in determining $EF_{BL,c}$, and the A_y used to calculate the ex ante emission reduction is only used in the ex ante calculation formula, so the relevant ex ante calculation data are listed in this section. 2. For A_y, the data is determined by collecting the project field sizes in a project database. The size of project fields is determined by GPS or satellite data. 3. In the latest version of PD, the measurement methods and procedures applied for GWP_{CH4} is updated to any future revision of the IPCC's assessment report should be taken account. 4. The methodology provides two kinds of methods, which are ex ante calculation and monitoring. The project proponent chose the ex ante calculation method, and then conducted methane measurement according to the requirements in the Appendix according to the requirements of the ex ante calculation method, and finally obtained the above value according to the calculation method in the Appendix of methodology. 5. Parameters of $SF_{BL,o}$ and $SF_{P,o}$ have been added in the latest version of PD.				
Documentation provided by project participant				

/1/- version 02	
DOE assessment	Date: 31/05/2021
The PD is checked as revised, CTI verified that 1. The explanation of ex ante determined parameters are listed in section 5.1 is provided. 2. Source of data for A_y is in line with the methodology, and how the data is measured is specified. 3. For GWP_{CH4}, the measurement methods and procedures applied is updated to any future revision of the IPCC's assessment report should be taken account which is verified as appropriate and in line with the requirement of VCS standard 4.1. 4. Justification of choice of data is in line with the requirement of the methodology related to ex ante determination of $EF_{BL,c}$. 5. Parameters of $SF_{BL,o}$ and $SF_{P,o}$ are added in line with the methodology.	

Refer to section 3.3.8 of this report for detail assessment.
CAR 14 is closed.

CAR ID	15	Section no.	5.2	Date : 30/04/2021
Description of CAR				
For the section 5.2, the following findings are issued,				
1. For $A_{s,g}$, description of measurement methods is not in line with the methodology, monitoring equipment is missing. 2. For $EF_{BL,s,g}$ and $EF_{P,s,g}$ frequency of monitoring is not in line with the requirement of the methodology, QA/QC procedure is not complete, the description of laboratory for gas analysis is not specified.				
Project participant response				Date : 28/05/2021
1. The size of project fields shall be determined by GPS or satellite data. Should such technologies not be available, established field size measurement approaches shall be used provided that uncertainties are taken into account in a conservative manner. And the monitoring equipment is GPS or satellite data. 2. $EF_{BL,s,g}$ and $EF_{P,s,g}$ are obtained from the calculation of the emission rate for baseline reference fields according to the requirements in the Appendix of methodology, and the $C_{CH_4,t}$ (CH_4 concentration in chamber at time t) of weekly gas samplings is derived from the laboratory analysis.				
Documentation provided by project participant				
/1/- version 02				
DOE assessment				Date: 31/05/2021
The PD is checked as revised, CTI verified that 1. Description of measurement methods for $A_{s,g}$, is in line with the methodology, monitoring equipment is added in line with the methodology. 2. Frequency of monitoring for $EF_{BL,s,g}$ and $EF_{P,s,g}$ is in line with the requirement of the methodology, QA/QC procedure is complete, the description of laboratory for gas analysis is specified. Refer to section 3.3.8 of this report for detail assessment. CAR 15 is closed.				

CAR ID	16	Section no.	5.3	Date : 30/04/2021
Description of CAR				
For the section 5.3, the following findings are issued,				
1. For Monitoring of farmers' compliance with project cultivation practice, the description is not in line with the requirements of the applied methodology. 2. For sample size determination, the description of logbook and is not in line with the requirements of the applied methodology 3. For monitoring frequency of farmers' compliance with project cultivation practice, the annually is not correct and in line with the applied methodology. 4. The sampling method for selection the famers from each town is not specified. 5. How the monitoring plan is in line with the requirement of "Project proponents shall assure that the project reference fields are cultivated in a way that they represent the ranges of cultivation practice elements on the project fields in a conservative manner with respect to methane emissions. Should farmers relevantly deviate from the defined project cultivation practice, so that their fields cannot be deemed to be represented by the reference fields any more, those fields shall not be taken into account for the determination of the aggregated project area $A_{s,g}$ of that season. This requirement shall assure that only those farms are considered for the calculation of emission reductions which comply with the project cultivation practice" as listed in the methodology is not clarified. 6. For Monitoring of baseline and project emissions, the process of measuring methane value and calculation of $EF_{BL,s,g}$ and $EF_{P,s,g}$, is not provided as per the applied methodology. 7. Determination of reference fields are not in line with the requirement of the methodology.				

8. Monitoring frequency is not provided for each monitoring parameter and is not in line with the requirement of the methodology. 9. The information of monitoring equipment installation and calibration and related requirement for the laboratory is not provided. 10. Emergency procedure is missing.	
Project participant response	Date : 28/05/2021
1. The description of monitoring of farmers' compliance with project cultivation practice is added as follows in the latest version of PD. Project proponent has established a database which holds data and information of these 3,713 households involved in this project activity, which contains the name, ID number, address of the head of the household, size of the field, completion date of construction, the starting date of rice season. Therefore, the sampling of logbooks is based on the database. 2. The description of logbook for sample size determination is added as follows in the latest version of PD. The calculation result for n is 314. Therefore, although all the farmers are required to complete the logbooks, only 314 sample logbooks from farmers will be selected from the sampling frame according to stratified sampling method at the beginning of each year during the crediting period. The template of logbook was compiled by Shanghai Libra in accordance with the requirements of methodology. 3. For monitoring frequency of farmers' compliance with project cultivation practice, the monitoring report from technician should be handled seasonally. 4. The sampling method for selection the famers from each town has been stated in the latest version of PD as follows. According to the number of samples needed for each town, the random sampling function of Excel is used to extract from the database mentioned above. 5. After the sampling logbooks are collected by the technicians, the expert will check the contents in the logbooks first to confirm whether the nitrogen application amount and drainage and irrigation frequency recorded by the farmers meet the requirements of the project activity, and then hand it to Shanghai Libra for final check, and then complete the monitoring report. 6. For Monitoring of baseline and project emissions, the process of measuring methane value and calculation of $EF_{BL,s,g}$ and $EF_{P,s,g}$, has been provided as per the applied methodology. In this project, there is only one field group, thus, three baseline reference fields and project reference fields should be selected respectively for methane emission measurement. Besides, project reference fields shall be established close to the baseline reference fields and begin with the growing season at the same time as required by the methodology that the measurements on project and baseline reference fields are carries out in an equal manner and simultaneously. The emission is the average of the measurement results from the three reference fields. The seasonally integrated emission factor $EF_{BL,s,g}$ (baseline) and $EF_{P,s,g}$ (project) shall be derived as average value from the three measurements for each group. Hefei Luyu, as the project proponent, prepares a detailed plan for the seasonal methane measurements before the start of the season. The plan for field measurement and laboratory analysis is shown in the latest version of PD. The implementation of methane measurement in both baseline and project reference fields is involved by the experts from Anhui Academy of Agricultural Sciences which is an institution owned the certificate to do the laboratory analysis. The expert who is the leader of the experiment has a doctoral degree and her field of study is agricultural environmental engineering. 7. The determination of reference fields has been provided as follows in the latest version of PD. The reference fields are fixed rice paddies with area of around 0.35 ha. The measurements on project and baseline reference fields are carried out in an equal manner and simultaneously. The baseline reference fields should be selected that they are representative of baseline scenario where double-cropping rice is planted by continuously flooded method without any organic amendments, while the project reference fields should be selected that they are representative of project scenario where double-cropping rice is planted by intermittent flooded method without any organic amendments.	

8. Monitoring frequency has been provided for each monitoring parameter in the latest version of PD as follows.
The monitoring frequency should be determined according to the methodology requirements for each parameter in the project after the project registration in order to ensure the continuity of the benefits. Firstly, the aggregated project area in a given season s ($A_{s,g}$) is required to be monitored by technicians for every season. Should farmers relevantly deviate from the defined project cultivation practice, so that their fields cannot be deemed to be represented by the reference fields any more, those fields shall not be taken into account for the determination of the aggregated project area $A_{s,g}$ of that season.
Secondly, baseline and project emission factor of group g in a given season s ($EF_{BL,s,g}$ and $EF_{P,s,g}$) are obtained from the calculation of the emission rate for baseline reference fields according to the requirements in the Appendix of methodology, and the $C_{CH_4,t}$ (CH_4 concentration in chamber at time t) of weekly gas samplings is derived from the laboratory analysis. So, technicians should do the on-field sampling one a week, while the laboratory analysis is conducted by experts from Anhui Academy of Agricultural Sciences every three times of samplings. It is an institution owned the certificate to do the laboratory analysis and the expert who is the leader of the experiment has a doctoral degree and her field of study is agricultural environmental engineering. Therefore, the accuracy of monitoring results can be guaranteed.
9. The information of monitoring equipment installation and calibration and related requirement for the laboratory has been provided as follows in the latest version of PD.
The installation and calibration of the closed chamber and laboratory analysis shall be in accordance with the requirements in the Appendix of methodology (shown in Table 5-6~5-8 of Section 5.2 above). The equipment used in this project has been qualified by China National Accreditation Service for Conformity Assessment. Among them, FID has been judged to be qualified by the Regulations of Calibrate Metrological Verification (JJG 700-2016). And the syringe, evacuated vial and the closed chamber used in this project have been judged to be qualified by the application requirement of CNAS-CL01 Accreditation Criteria for Testing and Calibrating Laboratory Competencies (CNAS-CL52_2014).
10. Emergency procedure has been provided as follows in the latest version of PD.
In this project, it is possible to cause equipment damage or missing data due to negligence and improper operation.
First of all, before the start of each growing season, Shanghai Libra should train technicians on how to check whether the equipment is working properly. After that, the technicians should check whether the equipment in the field is in good condition. Secondly, if there is any damage, the replacement should be completed before the land preparation, and the replacement should be recorded by Hefei Luyu and Shanghai Libra to ensure that the replaced equipment meets the requirements of this project. All the equipment should be in place before the start of growing season (land preparation). Thirdly, the technician should pay close attention to weather forecasts during rice planting. If extreme weather, such as heavy rain, is imminent, on-field gas sampling should be carried out before and after the extreme weather to ensure the monitoring frequency, at least once a week, required in the Appendix of methodology. Finally, if data loss or equipment damage occurs during the monitoring process, the corresponding emission reduction will be deducted in the most conservative way.

Documentation provided by project participant

/1/- version 02

DOE assessment

Date: 31/05/2021

The PD is checked as revised, CTI verified that

1. The description of monitoring of farmers' compliance with project cultivation practice is in line with the requirements of the applied methodology.
2. The description of logbook for sample size determination is in line with the requirements of the applied methodology.
3. Frequency for monitoring farmers' compliance with project cultivation practice is revised to be correct and in line with the applied methodology.
4. The sampling method for selection the famers from each town is specified.
5. The monitoring plan is revised to be in line with the requirement listed in the methodology.
6. The process of measuring methane value and calculation of $EF_{BL,s,g}$ and $EF_{P,s,g}$ is provided as per the applied methodology for Monitoring of baseline and project emissions,.
7. Determination of reference fields are in line with the requirement of the methodology.
8. Monitoring frequency is provided for each monitoring parameter and is in line with the requirement of the methodology.
9. The information of monitoring equipment installation and calibration and related requirement for the laboratory is provided.
10. Emergency procedure is added accordingly.

CAR 16 is closed.
